Introduction ix

Chapter 1. Hydro-mechanically Coupled Interface Finite Element for the Modeling of Soil–Structure Interactions: Application to Offshore Constructions 1

Benjamin CERFONTAINE and Robert CHARLIER

1.1. Introduction 2
1.1.1. The finite element method (FEM) 2
1.1.2. Review of existing contact formulations 3
1.1.3. Objectives 7
1.2. Governing equations of the interface problem 7
1.2.1 .Mechanical problem 8
1.2.2. Flow problem 12
1.2.3. Couplings between mechanical and flow problems 15
1.3. Numerical formulation of the element 16
1.3.1. Space and fluid pressure discretization 16
1.3.2. Mechanical problem 17
1.3.3. Flow problem 19
1.3.4. Time discretization 19
1.3.5. Stiffness matrix 20
1.4. Application 20
1.4.1. Suction caissons 20
1.4.2. Problem description 22
1.4.3. Tension loading 26
1.4.4. Lateral loading 37
1.5. Conclusion and perspectives 47
1.5.1. Conclusion 47
1.5.2. Perspectives 48
1.6. References 49

Chapter 2. DEM Approach for the Modeling of Geotechnical Structures in Interaction with Reinforcements 55

Pascal VILLARD

2.1. Introduction 55
2.2. Discrete modeling 56
2.2.1. General concepts of the discrete modeling approach 56
2.2.2. Specific interaction between discrete particles and reinforcement elements. 59
2.2.3. Numerical strategy for geotechnical structure modeling using DEM 61
2.3. Application of the DEM to geotechnical structures in interaction with rigid piles 61
2.3.1. Load transfer mechanisms within granular embankments over a network of piles 64
2.3.2. Load transfer mechanisms within granular embankments over a network of piles under cyclic loadings 71
2.4. Application of the DEM to geotechnical structures in interaction with flexible and deformable reinforcement – comparison with experiment results 76
2.4.1. Numerical and experimental behavior of geosynthetic tubes filled with granular material. 78
2.4.2. Numerical and experimental behavior of granular embankments reinforced with geosynthetic in areas prone to subsidence 87
2.5. Conclusion 96
2.6. References 96

Chapter 3. SSI Analysis in Geotechnical Engineering Problems Using a Finite Difference Method 101

Daniel DIAS and Orianne JENCK

3.1. Introduction 101
3.2. The finite difference method using an explicit scheme 102
3.3. Application of the finite difference method to soil–structure interaction problems 104
3.3.1. Structural elements 105
3.3.2. Interfaces 107
3.3.3. Constitutive models for soil 108
3.3.4. Dimension of the problem 111
3.3.5. Monotonic, quasi-static cyclic and dynamic loadings 112
3.4. Some application examples in the geotechnical engineering field. 112
3.4.1. Reinforced retaining walls 112
3.4.2. Tunneling 115

3.4.3. Soft soil improvement using vertical rigid piles . . . 121
3.5. Conclusion . . . 138
3.6. References . . . 139

Chapter 4. Macroelements for Soil–Structure Interaction . . . 143!

Diana SALCIARINI, Stéphane GRANGE, Claudio TAMAGNINI and Panagiotis KOTRONIS

4.1. Introduction . . . 143
4.2. The concept of generalized forces: Eurocode 8 recommendations. . . . 145
4.3. Macroelements for shallow foundations . . . 148
4.3.1. Generalities . . . 148
4.3.2. Macroelements formulated in the framework of hardening elastoplasticity . . . 150
4.3.3. Macroelements formulated in the framework of hypoplasticity . . . 151
4.4. The considered macroelements . . . 154
4.4.1. The elastoplastic macroelement . . . 154
4.4.2. The hypoplastic macroelement. . . . 156
4.5. Case study: seismic response of a reinforced concrete viaduct . . . 160
4.5.1. Features of the viaduct . . . 160
4.5.2. The finite element model of the viaduct and its foundations . . . 161
4.5.3. Seismic input . . . 163
4.6. Calibration of the macroelements . . . 164
4.7. Results of the numerical simulations . . . 167
4.7.1. Forces and displacements in the structural elements . . . 167
4.7.2. Displacements of the abutment and the foundations . . . 170
4.8. Concluding remarks . . . 172
4.9. References . . . 175

Chapter 5. Urban Seismology: Experimental Approach to Soil–Structure Interaction Towards the Concept of Meta-city! . . . 181!

Philippe GUÉGUEN, Philippe ROUX and Andrea COLOMBI

5.1. Introduction . . . 181
5.1.1.Observation of soil–structure interaction under weak and strong seismic loading . . . 183
5.1.2. Contamination of urban seismic motion by the vibration of buildings . . . 196
5.1.3. Conclusion . . . 202
5.2. References . . . 203

List of Authors . . . 211
