Foreword	ix
Introduction	xi
Chapter 1. Optical Architecture	1
1.1. Introduction	1
1.2. Optical theories of light phenomena	7
1.3. Optical systems for observation and detection	12
1.4. Main limitations of an optical system	18
1.4.1. Resolution power and Rayleigh criterion	18
1.4.2. The defects of a real optical instrument	28
1.4.3. Fourier optics and the spatial frequencies of an object	33
1.5. Light detection system in an optical system	38
1.5.1. Poynting vector and photon detection	39
1.5.2. Semiconductor-based detectors, photodiodes and CCDs	40
1.6. Application examples	45
1.6.1. Telescope observing the Sun	45
1.6.2. Spectrometer for measuring the solar spectrum and its variability over time	50
1.7. Conclusion	54
1.8. Appendix	55
1.8.1. Propagation of light in wave optics	55
1.8.2. Terrestrial radiation sensors	60
Chapter 2. Thermal and Electrical Architectures	65
2.1. Introduction	65
2.2. Electrical architecture of a CubeSat	69
2.2.1. The various components of electrical architecture	69

2.2.2. The attitude control system	72
2.3. Thermal architecture of a CubeSat	75
2.3.1. Thermal control	76
2.3.2. Thermal specifications for CubeSats	77
2.3.3. Thermal management technologies for CubeSats	78
2.4. Development and evaluation of thermal control	84
2.4.1. Phase 0: analysis	85
2.4.2. Phase A: feasibility study	85
2.4.3. Phase B: preliminary definition	85
2.4.4. Phases C and D: implementation and qualification	85
2.4.5. Phase E: in-orbit operation and decommissioning	87
2.5. Theories, models and simulation of thermal effects	87
2.5.1. Heat transfer by conduction, convection and radiation	88
2.5.2. Heat diffusion equation.	94
2.5.3. Devices or systems used for thermal effects management.	95
2.5.4. Example of an equation for heat diffusion in a telescope	99
2.6. Conclusion	104
2.7. Appendix	105
2.7.1. Quantities characterizing the exchange of luminous flux by radiation	105
2.7.2. View factor	109
2.7.3. Thermal environment in space.	113
2.7.4. Theoretical elements relating to thermomechanics and thermoelasticity	115
2.7.5. TRL scale (Technology Readiness Level – ISO 16290-2013)	119
Chapter 3. Environmental Testing	121
3.1. Introduction	121
3.2. Main limitations of a spatial system	127
3.2.1. The FIDES benchmark for predictive reliability	127
3.2.2. Reliability through RBDO simulation and digital twin procedure	132
3.3. Constraints of the space environment on the design of space systems	142
3.3.1. Mechanical launch environment.	142
3.3.2. Orbital environment	143
3.3.3. Space environment	143
3.4. Solar cycles.	143
3.4.1. Long-term solar cycle index	146
3.4.2. Short-term solar cycle index	146
3.5. The effects of the gravitational field	147
3.5.1. Gravitational force	147

3.5.2. Microgravity.	147
3.5.3. The atmospheric model, or neutral atmosphere	148
3.5.4. The gaseous constituents of the atmosphere at high altitude	149
3.5.5. The altitude density model	149
3.5.6. Aerodynamic drag	150
3.6. The effects of the magnetic field	151
3.6.1. Origin and variation of the geomagnetic field	152
3.6.2. The magnetosphere and its characteristics	152
3.6.3. The external magnetic field and its characteristics.	154
3.6.4. Magnetic field model and nominal values	154
3.6.5. Nominal values and characteristics of the magnetic field	155
3.6.6. South Atlantic Anomaly (SAA)	155
3.7. Effects due to plasma	156
3.7.1. Plasma environment in low Earth orbit	157
3.7.2. Plasma temperatures	158
3.7.3. Electrical charging and effects on the satellite	159
3.7.4. Effects of radiation	159
3.7.5. Effects of the Van Allen belt.	161
3.7.6. Electromagnetic radiation	161
3.7.7. Satellite lifespan.	161
3.8. Conclusion	162
3.9. Appendix	163
3.9.1. Statistics and probabilities, and generalized extremum law.	163
3.9.2. Example of thermal effect simulation using FEM	172
3.9.3. Preparation of the CubeSat: UVSQ-SAT NG	179
Chapter 4. Preparing for an Observation Mission	181
4.1. Introduction	182
4.2. Calibration of the UVSQ-SAT NG NIR spectrometer	186
4.2.1. Wavelength calibration.	187
4.2.2. Absolute response.	191
4.2.3. Bandwidth and aperture function	193
4.2.4. Temperature	196
4.3. Determination of the extraterrestrial solar spectrum using the Langley tracing technique.	197
4.3.1. Methodology	198
4.3.2. Considering atmospheric effects.	200
4.3.3. Calculation of optical depth	202
4.3.4. Conditions for accurate measurements using the Langley technique	202
4.4. Experimental results and discussion	203

4.5. Conclusion	209
4.6. Appendix	210
4.6.1. Analysis and processing of measurement data	210
4.6.2. The nonlinear simplex method.	216
4.6.3. The Levenberg–Marquardt method	219
4.6.4. The Broyden–Fletcher–Goldfarb–Shanno method.	221
4.6.5. Signal processing for deconvolving a measurement	221
4.6.6. Spectrum of a diatomic molecule in IR spectroscopy	226
Chapter 5. A Better Understanding of Light	233
5.1. The period from Antiquity to the Middle Ages	233
5.2. Initial approaches to interpreting light phenomena	235
5.3. First theorems and postulates of optics	238
5.4. Two teaching methods: Neoplatonism and Scholasticism	240
5.5. Science in the Middle East	241
5.6. Universities and science in Europe.	243
5.7. Optics after the Middle Ages and the scientific revolution.	248
5.7.1. The law of refraction and the speed of light in a medium	248
5.7.2. Geometric optics and wave optics	249
5.7.3. Photons and stimulated emission	250
5.7.4. Quantum optics and photon entanglement	253
5.8. Conclusion	256
5.9. Appendix	257
5.9.1. Elements of quantum mechanics	257
5.9.2. Thermal transfer modeling using the density matrix.	260
5.9.3. The nature of the photon and the quantum vacuum	265
Conclusion	275
