Preface	ix
Marc BERNACKI and Samuel FOREST	
Chapter 1. Dislocation-based Mechanics: The Various Contributions of Dislocation Dynamics Simulations	1
Sylvain QUEYREAU	
1.1. Introduction	1
1.2. Overview of discrete dislocation dynamics	2
1.2.1. Initial configurations and periodic boundary conditions	4
1.2.2. Mobility functions	5
1.2.3. Forces on dislocations	7
1.2.4. Topological changes	11
1.2.5. Boundary conditions	12
1.3. Mesoscale plasticity	15
1.3.1. Forest interactions	17
1.3.2. Statistical investigations of dislocation mechanisms	23
1.3.3. Lattice friction	29
1.3.4. Combination of multiple strengthening mechanisms	32
1.3.5. Toward polycrystalline plasticity	33
1.3.6. Cyclic deformations	40
1.4. Conclusion and future work	43
1.5. Acknowledgments	44
1.6. References	44

Chapter 2. Statistical Approach to the Representative Volume Element Size of Random Composites	55
Dominique JEULIN and Samuel FOREST	
2.1. Introduction	55
2.2. Elements of numerical homogenization of heterogeneous media	56
2.2.1. Examples of physical properties of heterogeneous media	56
2.2.2. Change of scale in heterogeneous media	57
2.2.3. Principle of calculation of apparent properties	58
2.2.4. Homogenization of random media by numerical simulations	63
2.3. Statistical definition of the RVE	64
2.3.1. Variance of estimation and integral range	65
2.3.2. Definition of the statistical RVE of apparent properties	67
2.3.3. Practical determination of the size of the RVE	69
2.3.4. Scaling of the bias, or systematic error	70
2.3.5. Determination of the size of the RVE in the nonlinear case	72
2.3.6. Remarks on the reduction of variance	73
2.4. Examples of application	73
2.4.1. Linear elastic properties and thermal conductivity	74
2.4.2. Elastic and viscoelastic properties of nanocomposites	89
2.4.3. Optical properties of nanocomposites	90
2.4.4. Fluid flow and permeability	94
2.4.5. Acoustic properties and wave propagation in fibrous media	95
2.4.6. Nonlinear properties	97
2.5. Conclusion	104
2.6. References	105
Chapter 3. Analytical Micromechanical Methods for Elasto-Viscoplastic Composites and Polycrystals	113
Stéphane BERBENNI and Samuel FOREST	
3.1. Introduction	113
3.2. Translated field method	116
3.2.1. Field equations and integral equation	116
3.2.2. TF-based method: theoretical foundations	118
3.2.3. TF method for elasto-viscoplastic two-phase composite materials	119
3.2.4. TF method for elasto-viscoplastic polycrystals using the SC scheme	125
3.3. The β -model dynasty for multiphase elastoviscoplastic polycrystals	127
3.4. Applications of the analytical micromechanical methods	131
3.4.1. Applications of the TF method to composites and polycrystals	131
3.4.2. Applications of β -models to elastoviscoplastic polycrystals at finite deformations	141

3.5. Concluding remarks	147
3.6. References	148
Chapter 4. Vertex and Front-Tracking Methods for the Modeling of Microstructure Evolution at the Solid State	155
Marc BERNACKI	
4.1. Introduction	155
4.2. Vertex frameworks	156
4.3. From Vertex to front-tracking then to enriched Vertex frameworks	160
4.4. Enrichment of the Vertex approach	163
4.5. Other front-tracking frameworks for the modeling of microstructure evolution	169
4.6. Conclusion	173
4.7. References	173
Chapter 5. Phase Field: Theory, Numerical Implementation and Applications	177
Ingo STEINBACH and Oleg SHCHYGLO	
5.1. Introduction	177
5.2. The soliton solution of a propagating wave front	179
5.3. Thermodynamically consistent derivation of the phase-field equations	183
5.4. The multi-phase fields approach	184
5.5. Multi-component alloy transformation	187
5.6. Multi-phase field with elasticity	191
5.7. Numerical treatment and applications	192
5.8. Examples	193
5.8.1. Martensitic transformation	193
5.8.2. Recrystallization and coarsening	194
5.8.3. Multicomponent solidification	198
5.9. References	199
Chapter 6. Level-Set Method for the Modeling of Microstructure Evolution	203
Marc BERNACKI	
6.1. Introduction	203
6.2. Kinetics equations of microstructure evolution at the mesoscopic scale	205
6.3. Level-set function, description of polycrystal and meshing adaptation	208
6.4. Isotropic framework for LS modeling of ReX and GG	213
6.5. Anisotropy of GB properties and CDRX modeling	218

6.5.1. LS formulations in context of anisotropic GB properties	218
6.5.2. CDRX modeling	225
6.6. Static/evolutionary SPPs	228
6.7. Modeling of diffusive solid-state phase transformation	235
6.8. Solute drag aspect	243
6.9. Conclusion	246
6.10. References	248
Chapter 7. Resolution Methods for Digital Materials – Recent Developments of Cellular Automaton Method	261
Lukasz MADEJ and Mateusz SITKO	
7.1. Introduction	261
7.2. Cellular automaton and applications	262
7.3. CA front tracking model within the static recrystallization case study	268
7.4. Calculation times and perspectives	281
7.5. References	284
List of Authors	291
Index	293
