General Introduction	ix
I.1. Why read this book?	ix
I.2. What is a model?	x
I.3. Why make models in process engineering?	xi
I.4. How to read this book?	xiv
 Chapter 1. From Laws of Nature to Dynamic Models of Processes	 1
1.1. General laws	1
1.2. Physical model: drying	2
1.2.1. Drying model at the scale of the individual grain or of the “thin layer”.	3
1.3. Biological model: example of brewing fermentation	19
1.3.1. Alcoholic fermentation model	20
1.3.2. Aroma compounds production model	33
1.4. Conclusion on the writing models	37
 Chapter 2. Models and Their Parameters	 41
2.1. Various quantities: constants and variables	41
2.2. How can parameters be found? A draft methodology	44
2.3. First set of plausible parameters.	45
2.3.1. Example of thin layer drying	45
2.3.2. Example of brewing fermentation	55

2.4. A first simulation	63
2.4.1. Example of thin-layer drying of grains	63
2.4.2. Example of brewing fermentation	66
2.5. Which are the important parameters? A sensitivity analysis	69
2.5.1. Absolute sensitivity, relative sensitivity.	69
2.5.2. Local sensitivity, global sensitivity	70
2.5.3. Linear scale, logarithmic scale	74
2.5.4. Example of the drying model	76
2.5.5. Example of brewing fermentation model	82
2.6. How to plan good dynamic experiments?	90
2.6.1. Example of a drying model	91
2.6.2. Example of brewing fermentation model	96
2.7. Conducting the experiments	101
2.7.1. Example of the drying process	101
2.7.2. Example of the fermentation process of brewing	103
2.8. Data-based calibration of parameters.	106
2.8.1. A measure of the effective precision of the model.	108
2.8.2. A measure of the expected precision of the model	109
2.8.3. Criterion for the calibration of the model	110
2.8.4. Data for calibration and data for validation.	111
2.8.5. Example of the drying model	112
2.8.6. Example of brewing fermentation	123
2.9. In case things go wrong: classic pitfalls and traps	147
2.9.1. Low-sensitivity parameters	147
2.9.2. Strongly correlated parameters	148
2.9.3. Very different orders of magnitude for the parameters	149
2.9.4. Very high or very low order of magnitude for the calibration criterion.	151
2.9.5. Local optima during the optimization of parameters	151
2.9.6. The optimized criterion does not reflect our real expectations.	154
2.10. Conclusion on the calibration of parameters.	155
 Chapter 3. Dynamic Optimization of Processes Using Models	 157
3.1. Introduction.	157
3.2. Graphic optimization: construction of customized nomograms	158
3.2.1. Example of the drying model	159
3.2.2. Example of brewing fermentation model	163

3.3. Multiobjective optimization: when the number of contradictory expectations and decision variables increases	165
3.3.1. How to compare solutions based on several criteria.	165
3.3.2. How to represent a dynamic optimization problem	168
3.3.3. Example of the drying process	171
3.3.4. Example of brewing fermentation process	179
3.4. MCDM: when a single solution should be retained	188
3.4.1. Human choice	189
3.4.2. Automated choice.	190
3.4.3. Example of the drying process	196
3.4.4. Example of brewing fermentation process	197
3.5. Conclusion	201
 Chapter 4. Brief Overview of Several Numerical Methods	 203
4.1. Introduction.	203
4.2. Numerical resolution of differential equations	204
4.2.1. Explicit schemes	206
4.2.2. Implicit schemes	206
4.2.3. Implicit form of differential equations.	207
4.2.4. Automatic management of the time step	207
4.2.5. Precision of the solution	208
4.2.6. Stiff equations	209
4.2.7. Systems of algebraic-differential equations.	211
4.3. Numerical approximation of derivatives.	213
4.3.1. Unilateral finite differences	214
4.3.2. Centered finite differences.	216
4.3.3. Polynomial approximation	218
4.4. Numerical optimization.	220
4.4.1. A formalization of the optimization problem.	221
4.4.2. Several types of problems	223
4.4.3. Several types of methods	226
4.4.4. Important particular cases	230
4.4.5. Several methods.	233
4.4.6. Optimization and models	235
4.5. Estimation of confidence intervals for the parameters of the model.	238
4.5.1. Rapid estimation based on a local approximation	239
4.5.2. Estimation based on random sampling	241
4.5.3. What confidence is there in the confidence interval?	244

4.5.4. Effect of a logarithmic transformation of parameters	244
4.5.5. Accepting highly uncertain parameters	245
4.6. Numerical libraries	247
4.7. Conclusion	250
General Conclusion.	253
C.1. What should be retained from this book?	253
C.2. How to build a model.	255
C.3. How to keep a model alive	260
C.4. How to go further	261
