Preface	ix
Acknowledgments	xi
Introduction	xiii
Chapter 1. Genomics and Epigenetics	1
1.1. DNA, RNA and genetic code	1
1.2. Sequencing and genomics	5
1.3. Transcriptome and proteome	10
1.4. Epigenetics, the missing link	13
Chapter 2. Overview of Cancer Chemotherapy	19
2.1. The introduction of an innovative method.	20
2.2. Nitrogen mustards, the first revival.	21
2.3. Anti-metabolites, the potential for chemotherapy finally revealed	25
2.4. Natural products in the first line.	28
2.4.1. Antimitotic agents	28
2.4.2. Topoisomerase inhibitors	30
2.5. Cisplatin and organoplatin derivatives	32
2.6. An evolving therapeutic approach	34
2.6.1. Combinatorial chemotherapy	35
2.6.2. Adjuvant chemotherapy	36
2.7. Targeted therapies	38

Chapter 3. Immunology and the Immune System	41
3.1. From variolation to vaccination	42
3.2. The hegemony of the humoral theory	44
3.2.1. Instructive theory versus selective theory.	45
3.2.2. Determining the chemical nature of antibodies	47
3.3. Towards a conciliation between cell theory and humoral theory	48
3.4. A complex and specific mode of action of a so-called adaptive immunity in collaboration with an innate immunity	51
3.4.1. The study of organ transplants for a better understanding of the immune system	51
3.4.2. The predominant role of MHC molecules on T cell reactivity	55
3.4.3. Other membrane molecules with a key role	56
3.4.4. B lymphocytes and antibody production	57
3.4.5. A collaboration with innate immunity.	59
3.4.6. Cytokines, immune system messengers.	60
3.5. Summary of innate and adaptive immune responses.	61
Chapter 4. The Development of Immunotherapy	63
4.1. Immunosuppressive treatments for graft tolerance.	63
4.2. Hybridoma techniques for the production of monoclonal antibodies	65
4.3. Towards an understanding of the immune response (anti- and pro-tumor)	68
4.3.1. Demonstration of the influence of the immune system on tumor activity	68
4.3.2. From the theory of immune surveillance to the “3 Es” theory	69
4.3.3. Antitumor factors	70
4.3.4. Protumor factors	71
4.4. Antitumor immunotherapy.	72
4.4.1. From Coley toxin to bone marrow and hematopoietic stem cell transplantation.	72
4.4.2. From T-cell cultures to antitumor vaccines.	74
4.4.3. Monoclonal antibodies: from rituximab to immune checkpoint inhibitors (ICI)	75
4.4.4. Radioimmunotherapy	76
4.5. A promising path tending towards improvement.	78

Chapter 5. The Maturation of Artificial Intelligence	79
5.1. From Babbage machines to the universal Turing machine	80
5.2. Cybernetics, for an association between machine and physiology: towards the development of the first neural network	82
5.2.1. Cybernetics	82
5.2.2. . . . to connectionism	83
5.2.3. The perceptron, an application of connectionism	84
5.3. Cognitivism and the true emergence of artificial intelligence	86
5.3.1. From the Logic Theorist	87
5.3.2. . . . to the LISP Language	88
5.4. From optimism to the first crisis	89
5.4.1. AI in a new momentum	89
5.4.2. Technical and theoretical limits finally revealed	90
5.5. Expert systems, a renewed interest in AI	92
5.6. The return of neural networks: an optimal method of automatic learning?	94
5.6.1. A renewal of the structure and method of learning	94
5.6.2. Different types of machine learning	97
5.6.3. A new wave of hope generated by neural networks and other learning techniques	98
5.7. A new crisis before a decisive rebound	100
5.7.1. A technological context not yet adapted	100
5.7.2. A set of factors at the origin of the Big Data era	101
5.8. Deep learning, an association between Big Data and neural networks: AI in another dimension	103
5.8.1. An evolution of structure and power	103
5.8.2. Convolutional networks, surprising performance	104
5.8.3. A wide range of applications as a trigger for investments	106
5.8.4. AI as an aid to oncology	108
 Chapter 6. The Evolution of Cancer Therapy	 111
6.1. Cancer surgery	111
6.1.1. Conventional surgery	113
6.1.2. So-called “minimally invasive” surgery	113
6.1.3. Image-guided surgery	114
6.1.4. Cryosurgery	114
6.1.5. Radiofrequency ablation	114
6.1.6. Laser surgery	115
6.1.7. Robotic surgery	115

6.2. External beam radiotherapy (or external beam radiation therapy)	117
6.3. Great innovations in one formula	121
6.4. Genomics and epigenetics	122
6.5. The new therapies of the 21st Century	124
6.5.1. Targeted therapies: the use of small inhibitory molecules (-nib)	125
6.5.2. The use of monoclonal antibodies (mAb)	126
6.5.3. CAR T-cells (Chimeric Antigen Receptor) for customized medicine.	128
6.5.4. Vaccine therapies	130
6.5.5. Targeted radionuclide therapy	131
6.6. Theranostics	133
6.6.1. The evolution of medical imaging	133
6.6.2. The theranostic approach, for a predictive and personalized medicine	137
6.7. Artificial intelligence (AI) and Big Data.	140
6.8. “ <i>In fine</i> ”	145
Conclusion	147
List of Abbreviations	161
References	169
Index	177
