Preface	xiii
Chapter 1. Highly Accelerated Testing	1
Philippe PUGNET, Pierre Richard DAHOO and Jean-Loup ALVAREZ	
1.1. Introduction	1
1.2. Load characteristics of the Super HAT equipment	3
1.3. Description of the Super HAT system.	4
1.3.1. System configuration	4
1.3.2. Control and monitoring system	6
1.3.3. Test profiles.	7
1.3.4. Utility operating conditions	9
1.4. Application.	10
1.4.1. Device under test.	10
1.4.2. Mounting of the DUT on the HAT vibration table	11
1.4.3. Testing for operating temperature limits	12
1.4.4. Testing for weaknesses due to rapid temperature changes	14
1.4.5. Testing for random vibration limits	14
1.4.6. Testing for limits due to the combined stresses of rapid temperature changes and random vibrations	16
1.4.7. Testing for limits due to the combined stresses of rapid temperature changes, random vibrations and moisture	17
1.4.8. Testing for weaknesses to rapid thermal variations, random vibrations and moisture	18

1.4.9. Test for weaknesses in electromagnetic compatibility functions to thermal stresses	19
1.5. Conclusion	21
1.6. References	22
Chapter 2. Aging Power Transistors in Operational Conditions	23
Pascal DHERBECOURT, Olivier LATRY, Karine DEHAIS-MOURGUES, Jean-Baptiste FONDER, Cédric DUPERRIER, Farid TEMCAMANI, Hichame MAANANE and Jean-Pierre SIPMA	
2.1. Introduction	23
2.2. Aging microwave power electronic components under operational conditions	24
2.2.1. Definition of the specifications for the realization of the workbench	24
2.2.2. Applying stresses and measuring aging process parameters	26
2.2.3. <i>In situ</i> I-V static characterization in pulse mode	28
2.2.4. Description of the <i>in situ</i> S-pulsed parameters measures	31
2.2.5. Setup developed to study transistor behavior in extreme cold start conditions	31
2.3. Application to the study of microwave power transistors	33
2.3.1. Reliability study of microwave LDMOS 330 W power transistor in operational conditions	33
2.3.2. Accelerated aging by overvoltage on LDMOS 330 W transistor	35
2.3.3. Low temperature endurance tests on 330 W LDMOS transistors	42
2.4. Conclusion	48
2.5. References	49
Chapter 3. Physical Defects Analysis of Mechatronic Systems	51
Christian GAUTIER, Eric PIERAERTS and Olivier LATRY	
3.1. Introduction	51
3.2. Equipment and methodology for analyzing failure in mechatronic systems.	53
3.2.1. Opening ceramic and resin casings	53

3.2.2. Equipment and technique for detecting and locating defects	56
3.3. Analysis of physical defects.	59
3.3.1. Analysis of an IGBT component after a highly accelerated test.	59
3.3.2. Analysis of a MOSFET component after electrical surge tests	65
3.3.3. Analysis of a GaN50W–HEMT component after the reliability test	67
3.3.4. Analysis of an LDMOS component after a high temperature operating life test (HTOL)	75
3.4. Conclusion	78
3.5. References	78

Chapter 4. Impact of Voids in Interconnection Materials. 81

Pierre Richard DAHOO, Malika KHETTAB, Christian CHONG, Armelle GIRARD and Philippe POUGET

4.1. Introduction	81
4.2. Thermal transfer and thermo-elasticity	84
4.2.1. Conduction	85
4.2.2. Convection	85
4.2.3. Radiation	86
4.2.4. Equation of heat diffusion	86
4.2.5. Thermo-mechanics and thermo-elasticity	88
4.3. Description of the numerical method	94
4.4. Simulation of thermal and thermomechanical effects in the interconnection material of an electronic module	96
4.4.1. Variation of the temperature and strain in the presence of a void defect	98
4.4.2. Maximum temperature as a function of the voltage or the size of the defect	100
4.4.3. Study of the effect of void defects in size and position in the ICM	102
4.4.4. Study of the effect of the disposition of void defects in the ICM	104
4.4.5. Thermomechanical effects on materials of a mechatronic power module	105
4.4.6. Analysis of results	106
4.5. Conclusion	107
4.6. References	108

Chapter 5. Electro-Thermo-Mechanical Modeling	111
Abderahman MAKHLOUFI, Younes AOUES and Abdelkhalak EL HAMI	
5.1. Introduction	111
5.2. Theory of electro-thermo-mechanical coupling	112
5.2.1. Heat dissipation equations	112
5.2.2. Electrothermal phenomena	116
5.2.3. Numerical formulation of electro-thermo-mechanical coupling	118
5.3. Simulation of electro-thermo-mechanical behavior using the finite element method	124
5.3.1. Strong coupling of electro-thermo-mechanical modeling	124
5.3.2. Weak coupling of electro-thermo-mechanical modeling	126
5.4. Example of an electro-thermo-mechanical simulation of an HBT transistor	127
5.4.1. General model of the HPA	128
5.4.2. Local model of the HBT transistor	132
5.5. Modal analysis of mechanical components	135
5.5.1. Equations for the vibratory problem	135
5.5.2. Variational formulation	136
5.5.3. Approximation by finite elements	137
5.5.4. Resolution in the frequency domain	139
5.6. Stochastic modal analysis of structures	140
5.7. Numerical identification of the elastic parameters of electronic components	142
5.8. Example of modeling and simulation of the vibratory behavior of mechatronic components	143
5.9. Conclusion	152
5.10. List of abbreviations and symbols	152
5.11. References	154
Chapter 6. Meta-Model Development	157
Bouzid AIT-AMIR, Philippe POUCKET and Abdelkhalak EL HAMI	
6.1. Introduction	157
6.2. Definition of a meta-model	158
6.3. Selection of factors: screening	158
6.4. Creation of designs of experiments	161
6.4.1. Central composite designs	161
6.4.2. Box–Behnken designs	165

6.4.3. D-optimal designs	166
6.4.4. Doehlert designs	166
6.4.5. Latin hypercube sampling (LHS) designs	168
6.5. Modeling of the response surface: PLS regression and Kriging	170
6.5.1. PLS regression	170
6.5.2. Kriging.	172
6.5.3. Model comparison and validation.	175
6.6. Sensitivity analysis of the model: variance decomposition, Sobol criterion	178
6.6.1. Principle.	178
6.6.2. Application of Kriging to a model	181
6.7. Robust design	182
6.8. Conclusion	186
6.9. References	187

Chapter 7. Probabilistic Study and Optimization of a Solder Interconnect 189

Bouchaib RADI, Nadia SAADOUNE and Abdelkhalak EL HAMI

7.1. Introduction	189
7.2. Electronic equipment.	190
7.2.1. Printed circuit board.	191
7.2.2. Electronic components	191
7.2.3. The solder materials	192
7.2.4. Solder alloys	192
7.3. Thermal modeling of the electronic board	194
7.3.1. Boundary conditions	194
7.3.2. Modeling the soldering of an electronic component	195
7.4. Probabilistic study of the effect of thermomechanical stresses on a solder joint	202
7.4.1. Probabilistic design methods.	203
7.4.2. Effect of the probability of properties of materials.	204
7.4.3. Analysis of the variability of the properties of materials	207
7.5. Optimization of the solder joint	209
7.5.1. Multiobjective optimization (MOO)	210
7.5.2. Optimization using metamodels	211
7.5.3. Structural optimization methods.	214
7.6. Conclusion.	218
7.7. References	219

Chapter 8. High-Efficiency Architecture for Power Amplifiers	221
Farid TEMCAMANI, Jean-Baptiste FONDER, Cédric DUPERRIER and Olivier LATRY	
8.1. Introduction	221
8.2. Main reliability parameters	222
8.3. Methodology	222
8.4. Aging tests	224
8.4.1. Test protocol	224
8.4.2. Impact of pulsed RF signal on the idle current I_{D0}	226
8.5. Other results	227
8.5.1. Performance monitoring	227
8.5.2. RF characterizations	228
8.5.3. Direct current (DC) measurements	230
8.6. Origin of degradations: discussion	232
8.7. Physical analysis	233
8.7.1. Description	233
8.7.2. Visual inspection	234
8.7.3. Localization of defects by non-destructive techniques	235
8.7.4. Degradation microstructural analysis: TEM and FIB	236
8.8. Amplifier design rules	239
8.8.1. Toward high-efficiency amplifiers	239
8.8.2. Introduction of the reliability in the transistor model	240
8.9. Conclusion	242
8.10. References	243
Chapter 9. Reliability Analysis based on Metamodels of Chip-Scale Packages (CSP)	247
Hamid HAMDANI, Abdelkhalak EL HAMI, Bouchaïb RADI	
9.1. Introduction	247
9.2. Description of the CSP packaging	249
9.3. Metamodeling and reliability analysis	250
9.3.1. Kriging metamodel	250
9.3.2. Probabilistic method based on metamodels for reliability evaluation	252

9.4. Probabilistic analysis of the reliability of CSP assemblies	253
9.4.1. Deterministic finite element model of the T-CSP	253
9.4.2. Uncertainties in T-CSP	262
9.4.3. Construction of the metamodel	263
9.4.4. Monte Carlo simulation based on the metamodel	266
9.5. Conclusion	269
9.6. References	269
List of Authors	273
Index	277
