<b>Preface</b> . . . . .	ix
<b>Introduction</b> . . . . .	xi
<b>Chapter 1. Geometric Features based on Curvatures</b> . . . . .	1
1.1. Introduction . . . . .	1
1.2. Some mathematical reminders of the differential geometry of surfaces . . . . .	2
1.2.1. Fundamental forms and normal curvature . . . . .	2
1.2.2. Principal curvatures and shape index . . . . .	5
1.2.3. Principal directions and lines of curvature . . . . .	6
1.2.4. Weingarten equations and shape operator . . . . .	9
1.2.5. Practical computation of differential parameters . . . . .	12
1.2.6. Euler's theorem . . . . .	13
1.2.7. Meusnier's theorem . . . . .	15
1.2.8. Local approximation of the surface . . . . .	16
1.2.9. Focal surfaces . . . . .	17
1.3. Computation of differential parameters on a discrete 3D mesh . . . . .	19
1.3.1. Introduction . . . . .	19
1.3.2. Some notations . . . . .	19
1.3.3. Computing normal vectors . . . . .	20
1.3.4. Locally fitting a parametric surface . . . . .	22
1.3.5. Discrete differential geometry operators . . . . .	22
1.3.6. Integrating 2D curvatures . . . . .	28

1.3.7. Tensor of curvature: Taubin's formula . . . . .	28
1.3.8. Tensor of curvature based on the normal cycle theory . . . . .	30
1.3.9. Integral estimators . . . . .	34
1.3.10. Processing unstructured 3D point clouds . . . . .	38
1.3.11. Discussion of the methods . . . . .	38
1.4. Feature line extraction . . . . .	46
1.4.1. Introduction . . . . .	46
1.4.2. Lines of curvature . . . . .	47
1.4.3. Crest/ridge lines . . . . .	55
1.4.4. Feature lines based on homotopic thinning . . . . .	79
1.5. Region-based approaches . . . . .	84
1.5.1. Mesh segmentation . . . . .	84
1.5.2. Shape description based on graphs . . . . .	87
1.6. Conclusion . . . . .	98
<b>Chapter 2. Topological Features . . . . .</b>	<b>99</b>
2.1. Mathematical background . . . . .	99
2.1.1. A topological view on surfaces . . . . .	100
2.1.2. Algebraic topology . . . . .	103
2.2. Computation of global topological features . . . . .	106
2.2.1. Connected components and genus . . . . .	106
2.2.2. Homology groups . . . . .	107
2.3. Combining geometric and topological features . . . . .	111
2.3.1. Persistent homology . . . . .	112
2.3.2. Reeb graph and Morse–Smale complex . . . . .	115
2.3.3. Homology generators . . . . .	118
2.3.4. Measuring holes . . . . .	121
2.4. Conclusion . . . . .	128
<b>Chapter 3. Applications . . . . .</b>	<b>131</b>
3.1. Introduction . . . . .	131
3.2. Medicine: lines of curvature for polyp detection in virtual colonoscopy . . . . .	131
3.3. Paleo-anthropology: crest/ridge lines for shape analysis of human fossils . . . . .	133
3.4. Geology: extraction of fracture lines on virtual outcrops . . . . .	137

3.5. Planetary science: detection of feature lines for the extraction of impact craters on asteroids and rocky planets . . . . .	140
3.6. Botany: persistent homology to recover the branching structure of plants . . . . .	143
<b>Conclusion</b> . . . . .	145
<b>References</b> . . . . .	149
<b>Index</b> . . . . .	169
