Preface	xv
Part 1. Foundations of the Method: General Approach and Major Prospects	1
Chapter 1. Motivations, Background and Introduction to Arcadia	3
1.1. Context and challenges	3
1.2. A bit of history: the creation of a method	4
1.2.1. Evolution of engineering	4
1.2.2. 2001–2006: First experiments using a model-based approach	5
1.2.3. 2006: From an engineering transformation plan toward a method	6
1.2.4. First deployments – new setbacks	7
1.2.5. Transition to an agile definition process of the method.	8
1.2.6. Global operational deployment and maturity.	8
1.3. Scope of application of Arcadia.	10
1.3.1. The collaborative development of the architecture, not the exploration	10
1.3.2. Cooperation with experts, but not their core profession	11
1.3.3. Definition and design of the architecture, not its development	11
1.3.4. Some very broad application scopes and areas.	11
1.4. Arcadia presentation	12
Chapter 2. Main Perspectives Structuring the Modeling Approach	15
2.1. From the need to the solution	15
2.1.1. Operational analysis (or OA)	15

2.1.2. System needs analysis (or SA)	15
2.1.3. Logical architecture (or LA)	16
2.1.4. Physical architecture (or PA)	16
2.1.5. Product building strategy (or BS)	16
2.2. Overview of the main concepts	16
2.3. An illustrative example: traffic regulation in the vicinity of a level crossing.	18
Chapter 3. Adaptation to Project Context and Life Cycle	19
3.1. Iterative or incremental approach	20
3.2. Scheduling activities	21
3.3. Top-down or bottom-up approach	21
3.4. Progressive and focused architecture construction	22
3.5. Activity adjustment and adaptation to a particular area	23
Chapter 4. General Approach to Functional Analysis	25
4.1. The role of functional analysis in Arcadia.	25
4.2. General principles of functional analysis in Arcadia.	26
4.2.1. Functions and exchanges	26
4.2.2. Missions, capabilities, functional chains and scenarios.	28
4.2.3. States and modes	30
4.2.4. Data model.	31
4.2.5. Non-functional characterization and analysis viewpoints	32
4.2.6. Summary	32
4.3. Functional analysis construction approach	32
4.3.1. Top-down hierarchical approach	32
4.3.2. Functional grouping bottom-up approach.	37
4.3.3. Functional construction/allocation approach.	39
4.3.4. Service functions and traversal functional chains based approach	41
4.3.5. Use case scenario based approach	43
4.3.6. The practical approach of functional analysis	45
4.3.7. Summary	46
Chapter 5. Operational Analysis	47
5.1. Principles	47
5.2. Define missions and required operational capabilities.	48
5.3. Perform operational needs analysis.	49
5.4. Summary	61
5.5. Exercise	61

Chapter 6. System Needs Analysis	63
6.1. Principles	63
6.2. Performing a capability compromise analysis	64
6.3. Performing a functional and non-functional needs analysis	67
6.4. Formalizing and consolidating the expression of system needs	82
6.5. Summary	84
6.6. Exercise	84
Chapter 7. Definition of the Principle Architecture or Logical Architecture	85
7.1. Principles	85
7.2. Definition of the factors impacting the architecture and analysis viewpoints	86
7.3. Definition of the behavior principles of the system	88
7.4. Construction of component-based system structuring alternatives	99
7.5. Selection of the architecture alternative offering the best trade-off	111
7.6. Summary	111
7.7. Exercise	112
Chapter 8. Definition of the Finalized Architecture or Physical Architecture	113
8.1. Principles	113
8.2. Definition of the structuring principles of the architecture and behavior	114
8.3. Detail and finalization of the expected system behavior	116
8.4. Construction and rationalization of one or more possible system architectures	122
8.5. Selection, completion and justification of the system architecture retained	138
8.6. Summary	139
8.7. Exercise	140
Chapter 9. Definition of Implementation, Development, Acquisition and Integration Contracts	141
9.1. Principles	141
9.2. Definition of the product breakdown structure	142
9.3. Finalization of development contracts of components to be implemented	144
9.4. Consolidation of the definition of components to be acquired	146
9.5. Definition of the IVV strategy.	147
9.6. Summary	148

Part 2. Method in Action: Using Engineering Models	149
Chapter 10. Mixing Viewpoints: Analysis and Specialties	151
10.1. Justification	151
10.2. Principles behind the approach	153
10.3. An illustration of some viewpoints	156
10.3.1. Operational analysis	157
10.3.2. System needs analysis	158
10.3.3. Logical architecture.	159
10.3.4. Physical architecture	161
10.3.5. Contracts development.	163
10.4. Summary	164
Chapter 11. Requirements Engineering and Modeling.	165
11.1. Limits of engineering based only on informal requirements	165
11.2. Using models as a support for expressing requirements	167
11.3. Link between informal and model requirements	169
11.4. Structuring requirements and the model	171
11.5. Summary	171
Chapter 12. Integration, Verification and Validation Approach.	173
12.1. Defining and implementing the test strategy	173
12.1.1. Principles	173
12.1.2. Defining the strategy for testing and integration	175
12.1.3. Optimizing multilevel IVV	177
12.1.4. Specifying test means.	178
12.1.5. Optimizing progress of the integration.	180
12.2. Verifying model requirements	182
12.2.1. Principles	182
12.2.2. Inspection.	183
12.2.3. Model analysis.	183
12.2.4. Demonstration and tests	184
12.3. Definition and use of scenarios and functional chains in IVV	185
12.4. Verifying informal requirements	188
12.5. Summary	189
Chapter 13. Articulation between Engineering Levels	191
13.1. Principles of the coengineering approach	191
13.2. Responsibility and limits of each engineering.	193
13.3. Articulation by informal requirements only	194
13.4. Model-based articulation	196

13.4.1. Single component transition	196
13.4.2. Multicomponent transition	200
13.4.3. Reusable component-based construction	204
13.4.4. Transition to design and development engineering	204
13.5. Articulation with the customer	206
13.5.1. Articulation between final customer and lead system supplier	206
13.5.2. Articulation between the lead supplier and a subsystem supplier	207
13.6. Summary	208
Chapter 14. System Supervision, States and Modes	211
14.1. Introduction to supervision	211
14.2. Principles and concepts	211
14.3. Articulation between states and modes in Arcadia perspectives	217
14.3.1. States and modes in operational analysis	217
14.3.2. States and modes in system needs analysis	218
14.3.3. States and modes in logical architecture	218
14.3.4. States and modes in physical architecture	219
14.3.5. States and modes between engineering levels	219
14.4. Approach to defining states and modes and the system supervision	220
14.4.1. Definition of expected behaviors	220
14.4.2. Analysis of superpositions of modes and states	222
14.4.3. Adapting architecture to superpositions	225
14.5. Designing supervision associated with system and components states and modes	226
14.5.1. Supervision functions and behavior	226
14.5.2. Articulation between system and components supervision	227
14.5.3. Analysis and verification of the conditions for system reconfigurations	229
14.6. Using the model for startup and shutdown procedures	230
14.7. Summary	231
Chapter 15. Contribution to Product Line Engineering	233
15.1. Context and position of the problem	233
15.2. General approach to product line engineering	235
15.2.1. Principles of the approach	235
15.2.2. Drivers and key activities in the approach	236
15.2.3. Benefits of the approach	237
15.3. Joint construction of architecture and product variability	239
15.3.1. Market analysis in operational analysis	239

15.3.2. Defining customer options in system needs analysis	246
15.3.3. Designing a logical and physical architecture compatible with the product policy	258
15.3.4. Deriving a configuration for a given customer or product using a subtractive approach	275
15.4. Additive or compositional engineering by building blocks	278
15.4.1. Engineering using reusable components, building blocks	278
15.4.2. Building a base of reusable components.	279
15.4.3. Defining a configuration by reusing components in an additive approach	280
15.5. Articulating system and subsystem product lines.	281
15.6. Summary	282
Part 3. Encyclopedia of the Language and Glossary of the Concepts of Arcadia	283
Chapter 16. Introduction to Arcadia Modeling Language.	285
16.1. The perimeter addressed	285
16.2. The logic behind presenting these concepts	286
16.3. Conventions for representation in figures and diagrams.	287
Chapter 17. Concepts of Functional and Operational Description.	289
17.1. Concepts and relationships of functional description	289
17.2. Function	290
17.3. Function port	291
17.4. Functional exchange and exchange category	291
17.5. Synthetic representation of functions and functional exchanges	292
17.6. Dataflow and flow control functions	293
17.7. System mission.	296
17.8. System capability	296
17.9. Functional chain	296
17.10. Function scenario.	299
17.11. Orchestration	300
17.12. Concepts and functional relationships in operational analysis	300
17.13. Operational activity	301
17.14. Operational interaction	302
17.15. Operational mission	302
17.16. Operational capability	302
17.17. Operational process	302
17.18. Operational activity scenario	303

Chapter 18. Concepts of States and Modes	305
18.1. Concepts and relationships involved in states and modes	305
18.2. Mode	305
18.3. State	306
18.4. Transition	306
18.5. Mode/state machine	307
18.6. Configuration	307
18.7. Situation	308
Chapter 19. Concepts of Structural Description	309
19.1. Concepts and relationships of structural description	309
19.2. System	310
19.3. Actor	310
19.4. Component	310
19.5. Behavioral component	310
19.6. Behavioral port	310
19.7. Behavioral exchange.	311
19.8. Logical component.	312
19.9. Hosting physical component	312
19.10. Physical port.	312
19.11. Physical link.	312
19.12. Physical path	314
19.13. Behavioral component scenario	314
19.14. Structural concepts and relationships in operational analysis	315
19.15. Operational entity and actor.	316
19.16. Communication means	316
19.17. Configuration item	316
Chapter 20. Links between Functional and Structural Descriptions	319
20.1. Concepts and relationships between functional and structural descriptions	319
20.2. Performing functions	319
20.3. Implementing functional ports	321
20.4. Implementing functional exchanges	321
20.5. Functional path	322
20.6. Functional component scenario	322
20.7. Links between dataflow, states and modes, and scenarios or functional chains.	324
20.8. Links between functional and structural descriptions in operational analysis.	325
20.9. Simplifications in representation	326

Chapter 21. Data Exchange Concepts and Links with Functional and Structural Concepts	329
21.1. Concepts and relationships involved in data exchanges and their use	329
21.2. Exchange item	330
21.3. Data model, class.	330
21.4. Allocating exchange items to functional ports and exchanges	331
21.5. Allocating exchange items to behavioral exchanges	332
21.6. Types and instances of data	332
21.7. Interfaces	332
21.8. Allocating interfaces to behavioral component ports.	332
21.9. Links between exchanges, exchange items and interfaces.	333
21.10. Interaction roles/and interface usage	334
21.11. Interaction protocol.	335
Chapter 22. Additional Concepts	337
22.1. Concepts for product line engineering	337
22.1.1. Variant	337
22.1.2. Variation point.	337
22.1.3. Variability model	338
22.1.4. Project configuration	338
22.2. Concepts for the integration, verification and validation approach	338
22.2.1. Integration version	338
22.2.2. Functional version.	338
22.2.3. Component functional contents.	339
22.2.4. Integration configuration.	339
22.2.5. IVV strategy	339
22.2.6. Test case	339
22.2.7. Test campaign	339
22.3. Other concepts not detailed here.	339
Chapter 23. Building the Global Model	341
23.1. The structure of an Arcadia model	341
23.2. Model segmentation to support alternatives	343
23.3. Using language concepts in perspectives.	345
23.3.1. Operational analysis	346
23.3.2. System needs analysis	346
23.3.3. Logical architecture.	347
23.3.4. Physical architecture	347
23.3.5. Product breakdown structure	348

23.4. Scope of links in the model.	348
23.5. Traceability between model elements	349
23.6. Replicable Element Collection and Replica	350
Conclusion and Perspectives	353
Appendix	357
Bibliography	363
Index	367
