Preface	ix
Chapter 1. Historical Abel-Gontcharoff Polynomials	1
1.1. Abel identity	1
1.2. Abel polynomials and expansions	2
1.3. Gontcharoff contribution	4
1.3.1. A digression to the Appell polynomials	5
1.3.2. Back to the A–G polynomials	6
1.4. Increased recognition	8
1.5. A first meeting problem	10
1.5.1. Poisson trajectory with lower boundary	10
1.5.2. First meeting level distribution	11
1.6. A final epidemic outcome	13
1.6.1. Reed–Frost epidemic process	13
1.6.2. Final state distribution	14
1.7. A goodness-of-fit test	16
1.7.1. Kolmogorov–Smirnov statistic	16
1.7.2. Non-rejection probability	17
1.8. Extension to pseudopolynomials	19
Chapter 2. Abel-Gontcharoff Pseudopolynomials	21
2.1. General framework: $\mathfrak{D}, \mathcal{E}, \mathfrak{F}, \Delta$	21
2.1.1. Previous simple situation	22
2.1.2. Choices of $\mathfrak{D}$ and $\mathcal{E}$	24
2.2. Copies $\hat{\mathcal{E}}$ and standard families	24
2.2.1. Copies $\hat{\mathcal{E}}$ of $\mathcal{E}$	24
2.2.2. Pseudopolynomials of Appell type	26
2.2.3. Standard families $\mathcal{E}$ and $\hat{\mathcal{E}}$	29

2.3. An integration operator I_u	30
2.4. A-G pseudopolynomials $\bar{G}_n(\cdot U)$	32
2.5. Expansions of A-G type	37
2.5.1. Some simple consequences	38
2.5.2. Back to the A-G polynomials	40
2.6. A shift operator S^a	42
2.7. A multiplication operator M^λ	46
2.8. Shift invariance property	48
2.8.1. Binomial-type identities	51
2.8.2. Taylor-type formula	52
2.8.3. Regarding integration	53
Chapter 3. General Theory and Explicit Results	55
3.1. Return to the shift invariance	55
3.1.1. The case where $x \in \mathfrak{D} = \mathbb{Z}$ (or $\mathbb{N}_0$)	56
3.1.2. The case where $x \in \mathfrak{D} = \mathbb{R}$	60
3.2. The higher dimensional case	66
3.2.1. The case where $\mathbf{x} \in \mathfrak{D} = \mathbb{R}^k$	66
3.2.2. The case where $\mathbf{x} \in \mathfrak{D} = \mathbb{R}^{\mathbb{N}}$	69
3.3. Calculation formulas for $\bar{G}_n(\cdot U)$	71
3.3.1. From an A-G type expansion of e_n	71
3.3.2. From the integral definition of $\bar{G}_n$	75
3.3.3. From the classical binomial identity	77
3.4. Geometric or affine form for U	80
3.4.1. When $U = \{u_i \equiv a, i \in \mathbb{N}_0\}$	81
3.4.2. When $U = \{u_i \equiv aq^i, i \in \mathbb{N}_0\}$	83
3.4.3. When $U = \{u_i \equiv a + bi, i \in \mathbb{N}_0\}$: first model	84
3.4.4. When $U = \{u_i \equiv a + bi, i \in \mathbb{N}_0\}$: second model	85
3.5. Extension to special sequences $\mathbf{u}_i = \{u_{i,j}\}$	87
3.5.1. When the $u_{i,j}$ do not depend on i	88
3.5.2. When the $u_{i,j}$ do not depend on j	89
3.5.3. When the $u_{i,j}$ are of the form $j\gamma_{i+j}/(i+j)(\beta_{i+j} - \beta_i)$	90
3.6. When $\mathcal{D}$ is the set of integers	93
Chapter 4. Further Results and Properties	97
4.1. A related basic family $\mathcal{E}(b)$	97
4.2. Upper and lower bounds for $\bar{G}_n(\cdot U)$	102
4.2.1. Upper bound for $ \bar{G}_n $	103

4.2.2. Non-negativity of $\bar{G}_n$	104
4.2.3. Lower bound for $\bar{G}_n$	107
4.3. Short visit to the A–G type series	111
4.4. Bilinear forms and biorthogonality	116
4.5. An alternative generalization	119
Chapter 5. Multi-index A–G Pseudopolynomials	129
5.1. Key definitions and expansions	129
5.2. Explicit formulas for $\bar{G}_{n_1, n_2}(\cdot U)$	132
5.3. Multivariate case $\bar{G}_{n_1, n_2}(\cdot U^{(1)}, U^{(2)})$	136
5.4. Integral multivariate representation	146
5.4.1. Single-index $\bar{G}_n$	146
5.4.2. Return to bivariate $\bar{G}_{n_1, n_2}$	147
5.5. Special case of A–G polynomials	149
Chapter 6. Randomizing A-G Pseudopolynomials	153
6.1. How to integrate stochasticity?	153
6.2. With u_i partial sums of i.i.d. variables	155
6.3. Multivariate additive extension	165
6.4. With u_i partial products of i.i.d. variables	170
6.5. Multivariate multiplicative extension	173
6.6. Additive case for exponential functions	176
Chapter 7. First Meeting Level with a Lower Boundary	183
7.1. Return to a classical Poisson process	183
7.2. For a compound Poisson process	186
7.3. Related first passage problems	190
7.3.1. When A and B are above F	190
7.3.2. When A and B are below F	191
7.3.3. When A is above F while B is below	192
7.4. With the number of Poisson jumps	193
7.5. For a linear birth process with immigration	196
7.6. Extension allowing multiple births	201
7.7. For a nonlinear birth process	204

Chapter 8. Less Standard First Meeting Models	211
8.1. Compound Poisson process with a renewal process	211
8.2. Linear birth process with a renewal process	214
8.3. Nonlinear death process with a birth process	217
8.4. Binomial process with a lower boundary	221
8.5. For a compound binomial process	224
8.6. Compound binomial process with a renewal process	226
Chapter 9. Martingales and A–G Pseudopolynomials	229
9.1. Motivation via damage-type models	229
9.1.1. Reed–Frost epidemic process	229
9.1.2. Nonlinear death process	230
9.1.3. Combined general and fatal epidemics	231
9.2. Unified treatment by A–G pseudopolynomials	232
9.3. Reed–Frost multipopulation epidemic	235
9.4. Nonlinear death process	237
9.5. Combined general and fatal epidemics	241
9.6. Time-dependent bivariate death process	246
9.6.1. Family of martingales	246
9.6.2. Bi-index A-G pseudopolynomials	248
9.6.3. Time-dependent analysis	251
Chapter 10. Towards a Non-homogeneous Theory	255
10.1. A non-stationary compound Poisson process	255
10.1.1. Revisited framework	256
10.1.2. A-G pseudopolynomials	260
10.1.3. First meeting problem	263
10.2. A compound Poisson random field	265
10.2.1. New framework	266
10.2.2. A-G pseudopolynomials	269
10.2.3. Revised first meeting concept	270
References	277
Index	281
