

# Contents

<b>Introduction . . . . .</b>	<b>xi</b>
Pascal PHILIPPOT	
<b>Chapter 1. Thermal Evolution of the Earth . . . . .</b>	<b>1</b>
Stéphane LABROSSE	
1.1. Brief historical note . . . . .	1
1.2. The present-day heat budget . . . . .	3
1.3. The Hadean Earth . . . . .	5
1.4. Direct observations of thermal evolution . . . . .	6
1.5. Parameterized models of evolution . . . . .	9
1.5.1. Heat transfer by convection . . . . .	9
1.5.2. Classic cooling models and thermal catastrophe . . . . .	11
1.5.3. Effect of a different exponent $\beta$ . . . . .	13
1.5.4. Effects of continents . . . . .	14
1.5.5. Effects of Earth's layered structure . . . . .	16
1.5.6. Thermal evolution of the core . . . . .	17
1.5.7. Effects of a stratified mantle . . . . .	20
1.6. Conclusion . . . . .	25
1.7. References . . . . .	26

<b>Chapter 2. Dynamics of the Mantle, Lithosphere, and Crust in the Archean . . . . .</b>	<b>33</b>
Patrice REY and Nicolas COLTICE	
2.1. Introduction . . . . .	33
2.2. Change in the composition of the upper continental crust: plate tectonics or denudation? . . . . .	35
2.2.1. A crustal perspective on continental growth . . . . .	35
2.2.2. A mantle perspective on continental growth . . . . .	39
2.3. Archean tectonics . . . . .	42
2.3.1. Beyond observations: numerical geodynamics . . . . .	44
2.4. Conclusions . . . . .	59
2.5. References . . . . .	61
 <b>Chapter 3. Precambrian Magnetic Field and Paleogeographic Reconstructions . . . . .</b>	<b>73</b>
Julie CARLUT and Mélina MACOUIN	
3.1. Introductory overview of Earth's magnetic field . . . . .	73
3.1.1. The magnetic field in the Ediacaran . . . . .	75
3.1.2. The Proterozoic: tracing back to the Archean (from 635 to 2,500 Ma) . . . . .	79
3.1.3. In the Archean (and before) . . . . .	81
3.1.4. Life under an unstable and weak magnetic field . . . . .	83
3.2. Using the Earth's magnetic field record to build paleogeographic reconstructions . . . . .	84
3.2.1. Insights from paleogeographic reconstructions . . . . .	84
3.2.2. Reconstructing the paleopositions of cratonic blocks and paleogeographies: paleomagnetism . . . . .	85
3.3. Precambrian paleogeographic models . . . . .	89
3.3.1. Supercratons/supercontinents . . . . .	89
3.3.2. The Archean and paleoproterozoic . . . . .	91
3.3.3. From the Paleoproterozoic to the Mesoproterozoic: Nuna supercontinent . . . . .	92
3.3.4. From the Mesoproterozoic to the Neoproterozoic: the Rodinia supercontinent . . . . .	92
3.3.5. The end of the Precambrian: toward the formation of Gondwana . . . . .	93
3.4. References . . . . .	95

---

<b>Chapter 4. Archean Magmatism . . . . .</b>	<b>103</b>
Jean-François MOYEN	
4.1. Introduction . . . . .	103
4.2. The lavas of the greenstone belts . . . . .	106
4.2.1. Basic and ultrabasic lavas . . . . .	108
4.2.2. Basic and intermediate lavas with “arc” affinity . . . . .	113
4.2.3. Acidic lavas and pyroclastic rocks . . . . .	114
4.3. Granitoids . . . . .	114
4.3.1. Granitoids derived from the melting of crustal lithologies . . . . .	117
4.3.2. Granitoids associated with a differentiation lineage: a mantle origin . . . . .	123
4.4. Gray gneisses . . . . .	124
4.5. Geodynamic considerations . . . . .	127
4.5.1. The magmas of the present-day Earth and their geodynamic significance . . . . .	127
4.5.2. Archean magmas and the dynamics of the ancient Earth . . . . .	129
4.5.3. On “subduction” . . . . .	129
4.5.4. The temporal evolution of Archean magmas . . . . .	131
4.6. References . . . . .	135
 <b>Chapter 5. Temperature and Chemical Composition of Precambrian Oceans . . . . .</b>	<b>145</b>
Johanna MARIN-CARBONNE and Christophe THOMAZO	
5.1. Introduction . . . . .	145
5.2. Very ancient oceans . . . . .	146
5.2.1. Liquid water on Earth since the Hadean . . . . .	146
5.2.2. The origin of water . . . . .	150
5.3. Ocean temperature during the Precambrian . . . . .	152
5.3.1. The faint young Sun paradox . . . . .	152
5.3.2. The importance of cherts in paleo-temperature reconstructions . . . . .	155
5.4. Characteristics and chemical evolution of the early oceans . . . . .	161
5.4.1. Ocean salinity . . . . .	162
5.4.2. Ocean alkalinity . . . . .	163
5.4.3. Ocean pH . . . . .	165
5.4.4. A story that smells of sulfur: from ferruginous to euxinic, the redox evolution of the oceans . . . . .	166
5.4.5. The evolution of metal element concentrations . . . . .	169

5.5. Conclusions and prospects . . . . .	170
5.6. References . . . . .	172
 <b>Chapter 6. Oxygenation of the Atmosphere . . . . .</b>	<b>183</b>
Pascal PHILIPPOT and Pierre SANS-JOFRE	
6.1. Introduction . . . . .	183
6.2. The major steps in oxygenation . . . . .	185
6.3. The origin of free dioxygen . . . . .	186
6.4. Factors controlling atmospheric oxygen levels . . . . .	187
6.5. The beginnings of oxygenation . . . . .	188
6.5.1. Biological record . . . . .	189
6.5.2. Geological record . . . . .	190
6.5.3. Sulfur isotope anomalies (MIF-S) . . . . .	195
6.6. The great oxidation event (2.45–2.2 Ga) . . . . .	199
6.7. The Boring Billion: 1.8–0.8 Ga . . . . .	202
6.8. Atmospheric oxygenation in the Neoproterozoic (NOE – 800–600 Ma) . . . . .	203
6.8.1. Very specific paleogeographic and tectonic conditions . . . . .	203
6.8.2. The Cryogenian: the “Snowball Earth” . . . . .	204
6.8.3. NOE and the key role of microbial sulfate reduction . . . . .	206
6.8.4. The emergence of the animal world in the Neoproterozoic . . . . .	210
6.9. References . . . . .	214
 <b>Chapter 7. Carbon, Sulfur and Iron Biogeochemical Cycles . . . . .</b>	<b>223</b>
Magali ADER, Vincent BUSIGNY and Christophe THOMAZO	
7.1. Introduction . . . . .	223
7.2. The biogeochemical carbon cycle . . . . .	225
7.2.1. Main carbon reservoirs and fluxes . . . . .	225
7.2.2. The $\delta^{13}\text{C}_{\text{carb}}$ of carbonate sedimentary rocks: a record of the $\delta^{13}\text{C}$ of DIC in the oceans . . . . .	226
7.2.3. The $\delta^{13}\text{C}_{\text{org}}$ of sedimentary rocks: a record of organic matter synthesis metabolisms . . . . .	233
7.2.4. Conclusion on the carbon cycle . . . . .	234
7.3. The biogeochemical sulfur cycle . . . . .	234
7.3.1. General overview: sources, sinks and fluxes . . . . .	234
7.3.2. Sedimentary record of the sulfur cycle . . . . .	237
7.3.3. Variability of sulfur isotopic compositions over geological time . . . . .	239
7.3.4. Conclusions on the sulfur cycle . . . . .	242

---

7.4. The biogeochemical iron cycle . . . . .	242
7.4.1. Distribution and speciation of iron in major terrestrial reservoirs . . . . .	242
7.4.2. Role of iron in the biosphere . . . . .	243
7.4.3. A central element in Precambrian biogeochemical cycles . . . . .	243
7.4.4. Record of the iron biogeochemical cycle in Precambrian oceans . . . . .	245
7.4.5. Secular variations in iron isotopic compositions . . . . .	246
7.4.6. Summary of iron cycle evolution in the Precambrian . . . . .	250
7.5. Conclusion on the functioning and interrelationships of the C, S and Fe cycles in the Precambrian. . . . .	250
7.6. References . . . . .	251
 <b>Chapter 8. Origins of Life and the Fossil Record</b> . . . . .	257
Sylvain BERNARD	
8.1. Introduction . . . . .	257
8.2. The question of origins . . . . .	258
8.2.1. Scenarios for the beginnings of life . . . . .	259
8.2.2. Limits of prebiotic chemistry . . . . .	262
8.3. The ancient fossil record . . . . .	265
8.3.1. The Apex microfossils . . . . .	265
8.3.2. The fossil record of Isua and Akilia . . . . .	268
8.3.3. Archean stromatolites . . . . .	270
8.3.4. On the concept of biosignature . . . . .	272
8.4. So what now? . . . . .	275
8.4.1. Experimental fossilization . . . . .	276
8.4.2. Another primitive Earth . . . . .	279
8.5. References . . . . .	283
 <b>Chapter 9. Mineral Deposits: Au, U, Fe-Mn.</b> . . . . .	299
Michel LOPEZ	
9.1. Introduction . . . . .	299
9.2. Place of the primitive and transitional Earth in the planet's metallogenic cycle . . . . .	301
9.3. From the primordial soup to the first ore deposits . . . . .	302
9.4. The planet's geochemical "kitchen" during the Precambrian, example of gold, uranium and iron-manganese . . . . .	306
9.4.1. The geochemical and biochemical cycle of gold . . . . .	306

9.4.2. The geochemical cycle of uranium. . . . .	310
9.4.3. The geochemical cycle of iron and manganese . . . . .	312
9.5. Gold on Earth during the Meso- and Neoarchean . . . . .	315
9.6. Uranium, the “traveling companion” of gold in the Meso- and Neoarchean. . . . .	320
9.6.1. 4.55–3.1 Ga: formation of the primitive uranium reservoir in refractory accessory minerals . . . . .	321
9.6.2. 3.1–2.2 Ga: formation of the first peraluminous granites with Th-rich uraninite and bacterial and gravitational enrichment in giant paleoplacers . . . . .	322
9.6.3. 2.2–0.45 Ga: first redox traps and crustal metasomatic deposits. . . . .	322
9.6.4. 0.45 Ga–present: uranium trapping in sandstones and redox fronts . . . . .	323
9.7. Iron and manganese on Earth in the Neoarchean–Proterozoic . . . . .	327
9.7.1. Importance of iron and manganese resources . . . . .	327
9.7.2. Mineralogy of banded iron and manganese ores and nature of precursor sediments . . . . .	329
9.7.3. Arguments for a hydrothermal source of iron, manganese and silica . . . . .	330
9.7.4. The fundamental role of life in oxidation mechanisms of iron and manganese behind BIF formation . . . . .	332
9.7.5. Classification and depositional models of Precambrian banded iron and manganese formations. . . . .	334
9.8. Conclusions. . . . .	346
9.9. References . . . . .	347
<b>List of Authors . . . . .</b>	<b>359</b>
