Introduction	xi
Christophe THOMAZO and Karim BENZERARA	
Chapter 1. Weathering of Rocks by Living Organisms	1
Bastien WILD and Damien DAVAL	
1.1. Rock weathering in the critical zone	1
1.2. Parameterization of mineral dissolution rates	2
1.2.1. General equation	3
1.2.2. Dissolution rate constant (k_{\min})	4
1.2.3. “Effective” surface area between the fluid and the mineral (S)	5
1.2.4. Specific effect of species dissolved in solution ($\prod [a_i]^{n_i}$)	6
1.2.5. Effect of deviation from thermodynamic equilibrium (ΔrG)	7
1.2.6. Effect of temperature (T)	8
1.2.7. Uninformed factors in the general equation	8
1.3. Modeling rock chemical weathering in the critical zone	10
1.3.1. A classic, essentially abiotic approach	10
1.3.2. Weathering by living organisms: why be interested in microorganisms?	12
1.3.3. How do microbial alteration processes occur in different types of ecosystems?	14
1.4. Mechanisms associated with microbial dissolution	17
1.4.1. Biofilms and micro-environments	17
1.4.2. Redox reactions	17
1.4.3. Acidolysis	18
1.4.4. Ligands	18
1.4.5. Mechanical effects	18
1.5. Biotic weathering by microorganisms	19
1.5.1. The mineralosphere	19
1.5.2. Bacteria	20
1.5.3. Fungi	23

1.6. What quantitative impact do living organisms have on mineral dissolution?	24
1.6.1. An absence of scientific consensus	24
1.6.2. Obstacles in assessing the microbial contribution	25
1.6.3. Towards new protocols to measure microbial contribution to weathering?	27
1.7. Conclusion	29
1.8. References	30
Chapter 2. Biomineralization: The Formation of Minerals by Living Organisms	47
Karim BENZERARA	
2.1. Introduction	47
2.2. Diversity of biominerals and biomineralizing organisms	50
2.2.1. Who are the biomineralizing organisms?	53
2.2.2. What are the differences between biominerals and their abiotic counterparts?	56
2.3. Biomineral formation mechanisms	58
2.3.1. How are minerals formed?	58
2.3.2. Principles of action of living organisms on the formation of minerals	62
2.3.3. Methods for studying biomineralization	68
2.4. Impact of biomineralization on how the Earth functions	74
2.5. Impact of biomineralization on the functioning of living organisms	76
2.6. Evolutionary history of biomineralization processes	77
2.7. Applications of biomineralogy	79
2.8. Conclusion	81
2.9. References	81
Chapter 3. Microbialites in the Fossil and Current Record	87
Emmanuelle VENNIN, Anthony BOUTON, Pierre BOUSSAGOL and Pieter T. VISSCHER	
3.1. Introduction	87
3.2. Microbialites: a continuous archive of Earth's history	88
3.2.1. Historical meaning of terms	88
3.2.2. Classification criteria for microbialites	89
3.2.3. Tools and methods for characterizing microbialites	92
3.2.4. Temporal and environmental distribution of microbialites	94
3.2.5. Fundamental, applied and societal implications of the study of microbialites.	97

3.3. How microbialites are formed	98
3.3.1. From microbial mats to microbialites	98
3.3.2. Chemical conditions favorable to mineralization	99
3.3.3. Controlling factors of microbialite formation	100
3.3.4. Environmental conditions favorable to the development of microbialites.	104
3.4. Preservation of microbialites in the fossil record	108
3.4.1. Preservation potential.	108
3.4.2. Early diagenesis, late diagenesis.	110
3.5. Examples illustrating the diversity of microbialites in current and fossil environments	111
3.5.1. Examples of current microbialites.	111
3.5.2. Ancient microbialites: some key periods of Earth's history recorded by microbial deposits.	112
3.6. Conclusions	115
3.7. References	116

Chapter 4. Molecular Approaches for the Study of Phylogenetic and Functional Diversity of Living Organisms 129

Miguel INIESTO, Ana GUTIÉRREZ-PRECIADO, Thomas BACCHETTA,
David MOREIRA and Purificación LÓPEZ-GARCÍA

4.1. Classifying and understanding living organisms	129
4.1.1. Taxonomy and classification systems of organisms	130
4.1.2. Molecular phylogeny and the tree of life	131
4.1.3. Analysis of diversity based on phylogenetic identity marker genes	133
4.1.5. Metagenomics and other “omics” approaches	135
4.2. Microbial diversity associated with microbialites.	137
4.2.1. Environmental context and sampling	138
4.2.2. Composition of microbial communities associated with microbialites through molecular tools	140
4.3. Functions of microbial communities associated with microbialites	143
4.3.1. Metagenomics.	144
4.3.2. Metatranscriptomics and other “omics” methods	146
4.4. Reconstruction of evolutionary history and inference of ancient traits	146
4.4.1. Taxonomic sampling, new lineages, tree of life	147
4.4.2. Reconstructing ancestral functions	148
4.5. Conclusions and perspectives.	150
4.6. References	151

Chapter 5. Oxygen: A Major Geobiological Player	161
Christophe THOMAZO	
5.1. Introduction	161
5.2. Oxygen: origin and properties	162
5.2.1. The cosmochemical origin of oxygen	162
5.2.2. The remarkable properties of oxygen	164
5.3. The geobiological history of oxygen on Earth	170
5.3.1. The environment of primitive Earth	171
5.3.2. Oxygenation events: tempo and consequences	181
5.4. Conclusion	188
5.5. References	188
Chapter 6. The Importance of Living Organisms in the Carbon and Nitrogen Cycles	197
Alice PELLERIN and Magali ADER	
6.1. Biogeochemical cycles	197
6.2. The carbon biogeochemical cycle	198
6.2.1. Why is the carbon biogeochemical cycle of interest?	198
6.2.2. The main carbon reservoirs and fluxes	198
6.2.3. Isotopic systematics of the carbon cycle	200
6.2.4. $\delta^{13}\text{C}_{\text{carb}}$ in sedimentary rock records oceanic $\delta^{13}\text{C}_{\text{CID}}$ record	202
6.2.5. Meaning of the relative stability of $\delta^{13}\text{C}_{\text{carb}}$ since 3.5 Ga	202
6.2.6. Reason for the $\delta^{13}\text{C}_{\text{carb}}$ variation between 2.3 and 2.0 Ga and between 750 and 540 Ma	205
6.2.7. $\delta^{13}\text{C}_{\text{org}}$ in sedimentary rocks records autotrophic metabolism.	206
6.2.8. Conclusions about the biogeochemical carbon cycle	207
6.3. The biogeochemical cycle of nitrogen	208
6.3.1. Why be interested in the nitrogen biogeochemical cycle?	208
6.3.2. Current major nitrogen reservoirs and fluxes.	208
6.3.3. Isotopic systematics of the nitrogen cycle	210
6.3.4. Ancient geological nitrogen records: preservation, reservoirs and fluxes	211
6.3.5. $\delta^{15}\text{N}$ in Precambrian sedimentary rocks: a record of ocean oxygenation	212
6.3.6. Distinguishing local effects from global changes	215
6.4. General conclusions – from a geochemical cycle to a biogeochemical cycle: how to detect the appearance of the first biological fluxes of nitrogen and carbon?	215
6.5. References	216

Chapter 7. Modeling the Biosphere and Its Interactions with the Geosphere	219
Guillaume LE HIR	
7.1. Introduction	219
7.2. Response of the biosphere to current global changes	223
7.2.1. Anthropogenic disturbance: the fragility of the atmosphere and the ocean	223
7.2.2. The divergence of response between the continental biosphere and the oceanic biosphere	224
7.2.3. Ocean–atmosphere exchanges	225
7.2.4. How the marine biosphere uses carbon	226
7.2.5. The biological pump and anthropogenic disturbance	231
7.2.6. The problem of regulating ocean oxygen	232
7.2.7. Limitations and advantages of the models	233
7.3. Geosphere–biosphere interaction during the colonization of continents by plants	234
7.3.1. How do plants cool the climate?	235
7.3.2. More complex modeling of the effects of plant colonization on climate	241
7.4. How to model biosphere during mass extinctions?	243
7.4.1. Mass extinctions, biomass crises seen by box models	243
7.4.2. Considering ecological niches in modeling the impact of an environmental disturbance on the biosphere: example of the Late-Ordovician extinction	247
7.4.3. Modeling theoretical habitat areas for a comparison of the effect of volcanism and an asteroid impact on the biosphere: example of the K-Pg extinction	248
7.4.4. Ongoing developments for more sophisticated modeling of interactions between the biosphere and environmental disturbances	249
7.5. Conclusion	250
7.6. References	251
Chapter 8. Fluctuations in Biodiversity Over Geological Time: An Illustration of the Earth/Life Connection	257
Arnaud BRAYARD	
8.1. Introduction	257
8.2. History of Life – how to measure it in time and space?	259
8.2.1. The pioneers	259
8.2.2. The advent of computing and big data sets	260
8.2.3. Biases in the fossil record	262
8.2.4. How can this be taken into account?	262
8.2.5. Big data	264

8.3. Extinctions and mass extinctions	265
8.3.1. List of major Phanerozoic extinctions.	265
8.3.2. Causes of extinctions	266
8.4. (Re)diversifications: some examples of interactions between the biosphere and the geosphere.	269
8.4.1. The more you dig.	270
8.4.2. The more they swim or float.	273
8.4.3. And on the continents?	276
8.5. Conclusion	276
8.6. References	277
Conclusions	285
Christophe THOMAZO and Karim BENZERARA
