

Contents

Foreword	ix
Introduction	xi
Chapter 1. Metrics, Definitions and Properties	1
1.1. Definitions and properties	2
1.2. Metric interpolation and intersection	6
1.2.1. Metric interpolation	7
1.2.2. Metric intersection	13
1.3. Geometric metrics	14
1.3.1. Geometric metric for a curve	16
1.3.2. Geometric metric for a surface	17
1.3.3. Turning any metric into a geometric metric	23
1.4. Meshing metrics	23
1.5. Metrics gradation	24
1.6. Element metric	31
1.6.1. Metric of a simplicial element	31
1.6.2. Metric of a non-simplicial element	37
1.6.3. Metric of an element of arbitrary degree	38
1.7. Element shape and metric quality	38
1.8. Practical computations in the presence of a metric	46
1.8.1. Calculation of the length	46
1.8.2. The calculation of an angle, area or volume	49
Chapter 2. Interpolation Errors and Metrics	53
2.1. Some properties	54
2.2. Interpolation error of a quadratic function	55
2.3. Bézier formulation and interpolation error	62
2.3.1. For a quadratic function	63
2.3.2. For a cubic function	66
2.3.3. For a polynomial function of arbitrary degree	80

2.3.4. Error threshold or mesh density	85
2.4. Computations of discrete derivatives	86
2.4.1. The L^2 double projection method	86
2.4.2. Green formula	88
2.4.3. Least square and Taylor	89
Chapter 3. Curve Meshing	93
3.1. Parametric curve meshing	95
3.1.1. Curve in \mathbb{R}^3	95
3.1.2. About metrics used and computations of lengths	99
3.1.3. Curve plotted on a patch	103
3.2. Discrete curve meshing	104
3.3. Remeshing a meshed curve	104
Chapter 4. Simplicial Meshing	107
4.1. Definitions	108
4.2. Variety (surface) meshing	109
4.2.1. Patch-based meshing	110
4.2.2. Discrete surface remeshing	119
4.2.3. Meshing using a volume mesher	120
4.3. The meshing of a plane or of a volume domain	122
4.3.1. Tree-based method	123
4.3.2. Front-based method	126
4.3.3. Delaunay-based method	129
4.3.4. Remeshing of a meshed domain	134
4.4. Other generation methods?	136
Chapter 5. Non-simplicial Meshing	141
5.1. Definitions	142
5.2. Variety meshing	143
5.3. Construction methods for meshing a planar or volume domain	145
5.3.1. Cylindrical geometry and extrusion method	147
5.3.2. Algebraic methods and block-based methods	148
5.3.3. Tree-based method	172
5.3.4. Pairing method	174
5.3.5. Polygonal or polyhedral cell meshing	176
5.3.6. Construction of boundary layers	177
5.4. Other generation methods	182
5.4.1. “Q-morphism” or “H-morphism” meshing	182
5.4.2. Meshing using a reference frame field	183
5.5. Topological invariants (quadrilaterals and hexahedra)	185
Chapter 6. High-order Mesh Construction	195
6.1. Straight meshes	196

6.1.1. Local node numbering	196
6.1.2. Overall node numeration	201
6.1.3. Node positions	204
6.1.4. On filling up matrices according to element degrees	207
6.2. Construction of curved meshes	208
6.2.1. First-degree mesh	209
6.2.2. Node creation	209
6.2.3. Deformation and validation	210
6.2.4. General scheme	211
6.3. Curved meshes on a variety, curve or surface	215
Chapter 7. Mesh Optimization	225
7.1. Toward a definition of quality	226
7.2. Optimization process	233
7.2.1. Global methods	233
7.2.1.1. Optimization of a cost function	233
7.2.1.2. Iterative relaxation of the position of vertices by duality (simplices)	234
7.2.1.3. Global optimization of the position of vertices (quadrilaterals and hexahedra)	235
7.2.2. Local operators and local methods	236
7.2.2.1. Vertex moves by barycentering	236
7.2.2.2. Vertex moves and Laplacian operator	237
7.2.2.3. Moving or removing vertices and flips by insertion or reinsertion	241
7.2.2.4. Edge flips	241
7.2.2.5. Cluster of edge flips	243
7.2.2.6. Edge or face flip by reinsertion	244
7.2.2.7. Edge slicing	244
7.2.2.8. Removal of an edge by merging	245
7.2.2.9. Metric field update	246
7.2.2.10. Topological and metric criteria	246
7.2.2.11. Strategies	246
7.3. Planar mesh	248
7.4. Surface mesh	250
7.5. Volume meshing	251
7.6. High-degree meshing	254
Chapter 8. Mesh Adaptation	265
8.1. Generic framework for adaptive computation, the continuous mesh	266
8.1.1. Duality between discrete and continuous geometric entities	267
8.1.2. Duality between discrete and continuous interpolation error	269
8.1.3. Discrete–continuous duality in one diagram	272
8.2. Optimal control of the interpolation error in L^p -norm	272
8.3. Generic scheme of stationary adaptation	279
8.3.1. Error estimators	282
8.3.2. Interpolation of solution fields	287

8.4. Unsteady adaptation	289
8.4.1. Space–time error estimators based on the characteristics of the solution . . .	290
8.4.2. Extension of the error analysis for the fixed-point algorithm for unsteady mesh adaptation	291
8.4.3. Mesh adaptation for unsteady problems	292
8.4.4. Unsteady mesh adaptation targeted at a function of interest	294
8.4.5. Conservative interpolation of solution fields	295
8.5. Mobile geometry with or without deformation	297
8.5.1. General context of the adaptation for mobile and/or deformable geometries .	297
8.5.2. ALE continuous optimal mesh minimizing the interpolation error in L^p -norm	298
8.5.3. Space–time error estimator for moving geometry problems	300
Chapter 9. Meshing and Parallelism	303
9.1. Renumbering via a filling curve	304
9.2. Parallelism: two memory paradigms and different strategies	307
9.3. Algorithm parallelization for mesh construction	312
9.4. Parallelization of a mesh construction process, partition then meshing	324
9.5. Mesh parallelization, meshing then partition	326
Chapter 10. Applications	331
10.1. Surface meshing	332
10.2. In computational fluid dynamics	334
10.3. Computational solid mechanics	341
10.4. Computational electromagnetism	345
10.5. Renumbering and parallelism	346
10.6. Other more exotic applications	349
Chapter 11. Some Algorithms and Formulas	353
11.1. Local numbering of nodes of high-order elements	354
11.2. Length computations etc., in the presence of a metric field	364
11.3. Quality	369
Conclusions and Perspectives	373
Bibliography	375
Index	387
