Introduction xli
Nicolas BAGHDADI and Mehrez ZRIBI

Chapter 1. Drylands and Desertification 1
Richard ESCADAFAL

1.1. Drylands 1
1.1.1. Common features 1
1.1.2. Desertification: a form of degradation specific to drylands 3
1.2. Dryland vegetation observed by satellite 3
1.2.1. Vegetation cover observed by satellite 4
1.2.2. Discontinuity of vegetation cover (patchiness) 8
1.2.3. Ligneous plants: a key element in discontinuous plant cover 9
1.3. Soils and surface materials: the dominant components of drylands 12
1.3.1. Sandstorms and the production of desert aerosols 13
1.3.2. The first millimeters of the surface 16
1.3.3. Monitoring of surface water: ponds, floods, ravines, etc. 18
1.3.4. Variable characteristics of surfaces: roughness, water content and temperature 19
1.3.5. Other applications 19

1.4. Conclusions and outlook 19
1.5. Key points 20
1.6. Bibliography 21

Chapter 2. Remote Sensing and Measuring Deforestation 27
Lilian BLANC, Valery GOND and Dinh HO TONG MINH

2.1. Introduction: forests, deforestation and forest degradation 27
2.2. Which images should be used for measuring deforestation? Limits and advantages 29
2.2.1. The contribution of optical data 29
2.2.2. Contribution of radar data 31
2.3. Methods for monitoring deforestation 32
2.3.1. Using optical data 32
2.3.2. Using radar data 34
2.4. Programs for estimating deforestation on a global scale 36
2.4.1. FAO/JRC program 37
2.4.2. Global Forest Change program 37
2.4.3. Japanese Space Agency program for mapping forest cover 40
2.5. Programs evaluating deforestation and degradation on a regional scale: some case studies 40
2.5.1. Estimating deforestation on a regional scale: the case of Brazil 40
2.5.2. Estimating forest degradation in French Guiana 44
2.6. Outlook 48
2.7. Key points 50
2.8. Bibliography 50

Chapter 3. Remote Sensing of Wildfires 55
Brigitte LEBLON, Jesús SAN-MIGUEL-AYANZ, Laura BOURGEAU-CHAVEZ and Martin KONG

3.1. Introduction 55
3.2. Fuel moisture estimation 56
3.2.1. Fire danger predicting systems 56
3.2.2. Optical remote sensing 60
3.2.3. Thermal infrared remote sensing 63
3.2.4. Synergisms between optical and thermal infrared remote sensing 67

3.2.5. Radar remote sensing 69
3.2.6. Synergisms between radar, optical and thermal infrared remote sensing 74
3.3. Fire detection 74
3.4. Burnt area mapping 81
3.5. Perspectives 85
3.6. Key points 87
3.7. Bibliography 88

Chapter 4. Characterization of Industrial Plumes 97
Pierre-Yves FOUCHER and Xavier BRIOTTET

4.1. Introduction 97
4.2. Principal characteristics of anthropogenic plumes 98
4.2.1. Composition of plumes 98
4.2.2. Specifics of observing plumes in an industrial environment 101
4.3. Optical properties of plumes 102
4.3.1. Anthropogenic aerosols 102
4.3.2. Anthropogenic gases 108
4.4. Characterization of aerosol plumes using remote sensing 115
4.4.1. Modeling of the spectral signature of aerosols in the reflective domain 115
4.4.2. Example of differential radiance ΔL 117
4.4.3. Characterization of aerosol properties 118
4.5. Characterization of gas plume properties 119
4.5.1. Introduction 119
4.5.2. Reflective domain 119
4.5.3. Thermal infrared range 128
4.6. Conclusions and outlook 141
4.7. Key points 141
4.8. Bibliography 142

Chapter 5. Monitoring of Earth Surface Motion and Geomorphologic Processes by Optical Image Correlation 147
André STUMPF, Jean-Philippe MALET, Anne PUISSANT and Julien TRAVELLETTI

5.1. Introduction 147
5.2. Sources of image data 149
5.3. Preprocessing 152

5.4. Principles of optical image correlation 155
5.4.1. Similarity–distance measures and search strategies 158
5.4.2. Sub-pixel precision 160
5.4.3. Search strategies 161
5.4.4. Postprocessing. 164
5.4.5. Algorithm implementation 165
5.5. Applications 167
5.5.1. Application to active tectonics 167
5.5.2. Applications to ice- and rock glaciers 169
5.5.3. Applications to landslides 171
5.5.4. Quantification of dune migration. 174
5.6. Current limitations and perspectives 175
5.7. Conclusions. 180
5.8. Key points 181
5.9. Acknowledgments 182
5.10. Bibliography 182

Chapter 6. Application of Optical Remote Sensing for Monitoring Environmental Impacts of Mining: From Exploitation to Postmining 191
Stéphane CHEVREL and Anne BOURGUIGNON

6.1. The environmental and societal stakes of mining 191
6.1.1. Environmental and societal impacts 191
6.1.2. The source–pathway–receptor paradigm 192
6.2. The role of Earth Observation 194
6.2.1. Introduction 194
6.2.2. Study scales, from a regional approach to the mine site 195
6.2.3. Identification, characterization and mapping of pollutant linkage elements and their spatial distribution. 195
6.3. Application examples 197
6.3.1. Visual identification of mining infrastructures from very high spatial resolution imagery 197
6.3.2. Mineral characterization and contamination mapping from very high spectral resolution imagery, Mpumalanga coal field, South Africa 201
6.4. Multisensor integrated approaches 205
6.4.1. Fusion of optical imagery and airborne geophysics 205
6.4.2. Modeling potential pollution transfer from a tailings dam. 210

6.4.3. Modeling mud flow propagation after a tailings dam failure 211
6.5. Exploitation of an airborne LiDAR DTM 214
6.5.1. Subsidence 214
6.5.2. Assessment of the potential for groundwater contamination by surface waters 216
6.6. Conclusions and perspectives 218
6.7. Key points 219
6.8. Acknowledgments 219
6.9. Bibliography 219

Chapter 7. The Contribution of SAR Data to Volcanology and Subsidence Studies 221
Virginie PINEL and Daniel RAUCOULES

7.1. Introduction 221
7.2. Principles of using satellite SAR data to measure ground displacement 222
7.2.1. Measuring ground displacement through sub-pixel correlation of SAR images (offset tracking) 222
7.2.2. Differential radar interferometry (DInSAR) 225
7.2.3. Performance and limitations of SAR data in measuring displacement 229
7.2.4. Multi-temporal processing 233
7.3. The contribution of InSAR to the understanding and monitoring of volcanoes 239
7.3.1. Types of deformation observed through InSAR on volcanoes 239
7.3.2. Quantification of magma storage at depth and link to eruptive activity 242
7.3.3. Temporal monitoring of the magma's path toward the surface 244
7.4. Contribution of InSAR to the characterization of anthropogenic subsidence 246
7.4.1. Deformation due to mining and post-mining 247
7.4.2. Pumping 249
7.4.3. Gas storage 250
7.4.4. Localized subsidence (collapse of cavities, dissolution, underground work, etc.) 251
7.5. Outlook 253
7.6. Appendix 1 254
7.6.1. Estimation of offsets through correlation in the frequency domain 254

7.7. Appendix 2 254
7.7.1. Interferometric coherence 254
7.8. Key points 255
7.9. Bibliography 256

Chapter 8. Applications of Remote Sensing to Locust Management 263
Alexandre LATCHININSKY, Cyril PIOU, Alex FRANC and Valérie SOTI

8.1. Introduction. 263
8.2. Potential of remote sensing in locust monitoring. 266
8.3. Case study 1: using SPOT satellite images to evaluate the impact of habitat fragmentation on population dynamics of the red locust *Nomadacris septemfasciata* in the Sofia basin in Madagascar 269
8.3.1. Study zone 270
8.3.2. Impact of habitat on red locust movements. 272
8.3.3. Data 272
8.3.4. Methods 273
8.3.5. Results 275
8.3.6. Conclusions 276
8.4. Case study 2: using Landsat satellite imagery to identify migratory locust *Locusta migratoria* oviposition sites in Central Asia 277
8.4.1. Introduction 277
8.4.2. Method 278
8.4.3. Results 279
8.4.4. Conclusions 281
8.5. Case study 3: estimation of the probability of presence of desert locust *Schistocerca gregaria* from satellite images of vegetation and historical ground data in Mauritania 282
8.5.1. Method 282
8.5.2. Results 284
8.5.3. Conclusions 286
8.6. Conclusions. 286
8.7. Key points 288
8.8. Acknowledgments. 288
8.9. Bibliography 288

Chapter 9. Applications of Remote Sensing to the Epidemiology of Infectious Diseases: Some Examples 295
Annelise TRAN, Daouda KASSIÉ and Vincent HERBRETEAU

9.1. Introduction 295
9.2. Hazard mapping: the distribution ranges and habitats of vector insects and reservoir hosts 298
9.2.1. Study of distribution ranges 299
9.2.2. The study of habitats 301
9.3. The contribution of remote sensing to the assessment of population vulnerability: health inequalities caused by social inequalities 303
9.4. The contribution of remote sensing to the modeling of epidemiological dynamics on a global scale 306
9.4.1. Prediction of risk zones and periods for transmission of vector-borne diseases 306
9.4.2. Application of remote sensing to non-vector-borne diseases 308
9.5. Prospects 309
9.6. Key points 312
9.7. Acknowledgments 312
9.8. Bibliography 312
