<b>Preface</b> . . . . .	xvii
<b>Chapter 1. Rotary Calcination Kiln: Heat Exchange by Radiation</b> . . . . .	1
1.1. General points . . . . .	1
1.1.1. Purpose of calcination kilns . . . . .	1
1.1.2. Specific characteristics of heat transfer . . . . .	1
1.1.3. Gas heating in kilns. . . . .	1
1.2. Description . . . . .	2
1.2.1. Basic principle of the kiln . . . . .	2
1.2.2. Gas circulation in the kiln . . . . .	3
1.2.3. Support . . . . .	5
1.2.4. Lining. . . . .	6
1.2.5. Seals at drum ends . . . . .	7
1.2.6. Kinematic drive train in calcination kilns. . . . .	7
1.2.7. Feeding a rotary dryer . . . . .	8
1.2.8. Grain breaking . . . . .	8
1.2.9. Shaft power of the electric motor . . . . .	9
1.2.10. Axial transport of products in a bare drum in the absence of gas . . . . .	11
1.2.11. Determining the angle of progression $\alpha$ . . . . .	12
1.2.12. Expression of time spent in the drum . . . . .	13
1.2.13. Accounting for the presence of gas. . . . .	13
1.2.14. Fill ratio. . . . .	15
1.3. Heat transfer by radiation: basic concepts . . . . .	15
1.3.1. Working hypothesis . . . . .	15
1.3.2. Key concepts . . . . .	17
1.3.3. Kirchoff's law for surfaces . . . . .	18

1.3.4. Luminance and emitted flow density . . . . .	19
1.3.5. Specular reflection and diffuse reflection. . . . .	22
1.3.6. Radiosity of a perfect exchange surface. . . . .	23
1.3.7. Equivalent direct transfer surface . . . . .	24
1.3.8. Equivalent trajectory and average trajectory through a gas . . . . .	25
1.3.9. Emissivity, absorptivity and transmissivity of the gaseous mixture (calculation). . . . .	26
1.3.10. Distribution of direct radiation . . . . .	29
1.3.11. Energy flow density emitted by each wall element. . . . .	32
1.3.12. Net flow received by surface $A_i$ . . . . .	35
1.3.13. Difference between net received flow and absorbed flow . . . . .	35
1.3.14. Net flow for a gray surface surrounding a gray gas. . . . .	36
1.3.15. Net flow for two surfaces in close proximity . . . . .	37
1.3.16. Evaluating EDTS. Some simple specific examples. . . . .	37
1.4. Heat transfer in rotary calcination kilns . . . . .	39
1.4.1. Transfer mechanism . . . . .	39
1.4.2. Equivalent direct transfer surface for the bare wall and free surface of the product . . . . .	40
1.4.3. Net flow densities received by the wall and the product . . . . .	42
1.4.4. Regeneration from the wall . . . . .	44
1.4.5. Expression of additional coefficients for heat transfer. . . . .	46
1.4.6. Solution to the wall equation . . . . .	46
1.4.7. Overall thermal power transferred to the product for calcination . . . . .	49
<b>Chapter 2. Tubular Heat Exchangers and Flat-plate Heat Exchangers . . . . .</b>	<b>55</b>
2.1. Description of exchangers . . . . .	55
2.1.1. Possible configurations . . . . .	55
2.1.2. Tube characteristics . . . . .	56
2.1.3. Shell diameter and tube bundle diameter. Number of tubes . . . . .	57
2.1.4. Transversal baffles (characteristics) . . . . .	59

2.2. Calculations on the tube side . . . . .	60
2.2.1. Heat transfer inside the tubes (clear liquid or gas). . . . .	60
2.2.2. Heat transfer inside the tubes (liquid-solid dispersion). . . . .	63
2.2.3. Pressure loss inside the tubes . . . . .	66
2.3. Calculations on shell side . . . . .	67
2.3.1. Gross transfer coefficient, shell side (Bell method) . . . . .	67
2.3.2. Coefficient correction for leakage . . . . .	71
2.3.3. Pressure loss due to crossflow current. . . . .	72
2.3.4. Pressure drop: shell side . . . . .	74
2.3.5. Overall heat transfer coefficient . . . . .	78
2.4. Practical data . . . . .	79
2.4.1. Usual pressure drop values . . . . .	79
2.4.2. Computerized exchanger calculations. . . . .	80
2.4.3. Note: caloric temperature . . . . .	81
2.5. Plate exchangers . . . . .	82
2.5.1. Description. . . . .	82
2.5.2. Number of transfer units. . . . .	83
2.5.3. The pressure loss coefficient . . . . .	84
2.5.4. Plate grouping and correction coefficient. . . . .	85
2.5.5. Fouling . . . . .	86
2.5.6. Construction materials . . . . .	86
<b>Chapter 3. Finned Tube Exchangers . . . . .</b>	<b>89</b>
3.1. General points . . . . .	89
3.1.1. Purpose of finned tubes . . . . .	89
3.1.2. Types of finned tube exchangers . . . . .	89
3.1.3. Definition of the frontal area . . . . .	90
3.2. Technical data . . . . .	90
3.2.1. Bundle layout . . . . .	90
3.2.2. Air cooler header boxes . . . . .	90
3.2.3. Finned tube characteristics for air coolers . . . . .	91
3.3. Fin efficiency. . . . .	93
3.3.1. Preliminaries. . . . .	93
3.3.2. Temperature range in a fin . . . . .	94
3.3.3. Calculation of zero- and first-order modified Bessel functions. . . . .	96
3.3.4. Definition of efficiency . . . . .	97
3.3.5. Theoretical efficiency calculation . . . . .	98
3.3.6. Approximate calculation of efficiency . . . . .	101

3.4. Other thermal parameters. . . . .	102
3.4.1. Transfer coefficient: gas side . . . . .	102
3.4.2. Overall coefficient for bare tubes . . . . .	103
3.4.3. Output temperatures (pure crossflow current) . . . . .	104
3.4.4. Outlet temperature (pure counterflow current). . . . .	106
3.4.5. Crossflow current (multiple passes in relation to gas) . . . . .	106
3.5. Determining geometry . . . . .	107
3.5.1. Number of rows and frontal surface . . . . .	107
3.5.2. Mathematical functions . . . . .	109
3.5.3. Number of tubes per pass . . . . .	110
3.5.4. Width of tube layers . . . . .	111
3.5.5. Number of tubes per layer and per pass. . . . .	112
3.6. Simulation and direct calculation . . . . .	114
3.6.1. Simulation . . . . .	114
3.6.2. Direct calculation . . . . .	114
3.7. Fans . . . . .	116
3.7.1. General points . . . . .	116
3.7.2. Position. . . . .	116
3.7.3. Diameter . . . . .	117
3.7.4. Number. . . . .	118
3.7.5. Fan power . . . . .	118
3.8. Implementation of air coolers . . . . .	119
3.8.1. Regulation . . . . .	119
3.8.2. Frost-proofing . . . . .	120
3.8.3. Air-side fouling . . . . .	120
<b>Chapter 4. Scraped Surface Heat Exchangers, Spherulation Towers and Solidification on a Moving Surface . . . . .</b>	<b>123</b>
4.1. General points . . . . .	123
4.1.1. Benefits when using viscous products. . . . .	123
4.1.2. Possible designs and heat transfer . . . . .	124
4.2. Types of scraped surface heat exchanger . . . . .	125
4.2.1. Quasi-gapless mechanisms, almost completely immune to wear . . . . .	125
4.2.2. Mechanisms with small gap size, subject to wear . . . . .	129
4.2.3. Mechanisms with a wide gap between the blade and the wall. . . . .	129
4.3. Spherulation towers . . . . .	131
4.3.1. Introduction . . . . .	131
4.3.2. Droplet formation. . . . .	132

4.3.3. Practical data . . . . .	132
4.3.4. Dimensioning . . . . .	133
4.3.5. Pollution . . . . .	137
4.4. Continuous solidification on a moving surface . . . . .	137
4.4.1. Principle . . . . .	137
4.4.2. Elements involved in a calculation. . . . .	137
<b>Chapter 5. Efficiency of Single-phase Heat Exchangers: Fouling . . . . .</b>	<b>139</b>
5.1. Number of transfer units and efficiency . . . . .	139
5.1.1. Mean logarithmic temperature difference (MLTD). . . . .	139
5.1.2. Number of transfer units (NTU) . . . . .	142
5.1.3. Efficiency . . . . .	143
5.1.4. Applications of the notion of efficiency. . . . .	146
5.1.5. Multipass exchangers and coefficient F. . . . .	150
5.2. Fouling . . . . .	152
5.2.1. Heat transfer design . . . . .	152
5.2.2. Common types of fouling . . . . .	153
5.2.3. Practical consequences of fouling . . . . .	154
5.2.4. Typical fouling values . . . . .	155
5.2.5. Calculation of wall temperatures. . . . .	155
<b>Chapter 6. Condensers, Traps and Condensate Lines . . . . .</b>	<b>157</b>
6.1. Surface condensers . . . . .	157
6.1.1. Structure . . . . .	157
6.1.2. Assembly. . . . .	157
6.1.3. Isothermal condensation coefficient of pure vapor . . . . .	158
6.1.4. Calculation of a pure vapor condenser . . . . .	161
6.1.5. Heat flow densities for mixed vapors . . . . .	162
6.1.6. Case of condensable vapor in the presence of non-condensable elements. . . . .	163
6.1.7. Mixture of two condensable vapors . . . . .	164
6.1.8. Evaluation of $D_{am}/\delta$ and $D_{AB}/\delta$ . . . . .	166
6.1.9. Evaluation of $y_{Ac}$ and $x_{Ac}$ . . . . .	167
6.1.10. Coolant flow . . . . .	168
6.1.11. Calculation of the surface of a condenser . . . . .	168

6.2. Overcooling of the condensate . . . . .	169
6.2.1. General points . . . . .	169
6.2.2. Transfer coefficient for overcooling . . . . .	169
6.3. Contact condensers . . . . .	171
6.3.1. General points . . . . .	171
6.3.2. Calculation of contact condensers . . . . .	173
6.4. Trap types. . . . .	177
6.4.1. Use of condensate traps . . . . .	177
6.4.2. Thermostatic bimetallic trap . . . . .	177
6.4.3. Balanced liquid expansion thermostatic trap . . . . .	178
6.4.4. Balanced pressure steam trap . . . . .	178
6.4.5. Inverted bucket steam traps . . . . .	179
6.4.6. Free-float traps . . . . .	180
6.4.7. Thermodynamic traps . . . . .	180
6.5. Trap selection and assembly . . . . .	182
6.5.1. Trap installation (classic assembly) . . . . .	182
6.5.2. Direct draining to the atmosphere . . . . .	183
6.5.3. Bypass to the condensate network . . . . .	183
6.5.4. Banging in vapor pipes . . . . .	183
6.5.5. Flowrate of condensate for drainage in steam pipes . . . . .	184
6.5.6. Trap selection . . . . .	185
6.6. Condensate lines . . . . .	186
6.6.1. Evacuation and use of condensates . . . . .	186
<b>Chapter 7. Boiling and Heat Transfer . . . . .</b>	<b>189</b>
7.1. Stagnant boiling . . . . .	189
7.1.1. Definitions . . . . .	189
7.1.2. Density of heat flowrate through the wall . . . . .	190
7.1.3. Calculation of overheating of the wall . . . . .	191
7.1.4. Drying of the wall . . . . .	194
7.2. Convective boiling . . . . .	196
7.2.1. Heat transfer coefficient . . . . .	196
<b>Chapter 8. Thermosiphon Reboilers . . . . .</b>	<b>201</b>
8.1. Manual method. . . . .	201
8.1.1. Operating principle . . . . .	201
8.1.2. Identifying the level where boiling starts . . . . .	202
8.1.3. Calculation of pressure drops and verification of driving height of liquid in the reservoir or column bottom . . . . .	205
8.1.4. Verification of heat transfer intensity . . . . .	211

---

8.2. Computerized method . . . . .	213
8.2.1. Reboiler calculations through simulation . . . . .	213
8.2.2. Reboiler calculation by direct determination . . . . .	223
8.3. Operational stability of thermosiphon reboilers (breathing) . . . . .	224
8.3.1. Mechanism of the phenomenon . . . . .	224
8.3.2. Practical factors affecting boiler stability . . . . .	225
<b>Chapter 9. Concentrating Solutions by Vaporization . . . . .</b>	<b>227</b>
9.1. Introduction . . . . .	227
9.1.1. Terminology . . . . .	227
9.2. Boiling delay . . . . .	228
9.2.1. Definition . . . . .	228
9.2.2. Calculating boiling delay . . . . .	228
9.3. Multiple-effect evaporation . . . . .	233
9.3.1. Ideal specific consumption . . . . .	233
9.3.2. Specific consumption in practice . . . . .	234
9.3.3. Possible layouts . . . . .	234
9.3.4. Liquor preheating . . . . .	238
9.3.5. Thermal balance of an effect . . . . .	239
9.3.6. Material and thermal balances of a multiple effect system (manual method) . . . . .	240
9.3.7. Computerized calculation of the material balance . . . . .	241
9.3.8. Computerized calculation of overall thermal balance . . . . .	243
9.3.9. Heat losses . . . . .	243
9.4. Vapor recompression . . . . .	244
9.4.1. Thermocompression of vapor . . . . .	244
9.4.2. Mechanical vapor recompression (MVR) . . . . .	244
9.5. Description, choice and calculation of evaporators . . . . .	245
9.5.1. Short tube evaporators (sugar refiners) . . . . .	245
9.5.2. Climbing evaporators . . . . .	246
9.5.3. Forced circulation evaporators . . . . .	247
9.5.4. Falling film evaporators . . . . .	249
9.5.5. Other evaporator types . . . . .	250
9.5.6. Evaporator calculation . . . . .	251
9.5.7. Vapor separators . . . . .	251
9.5.8. Physical properties used in the calculation of vaporization devices . . . . .	251
9.5.9. Order of magnitude of heat transfer coefficients . . . . .	252

---

<b>Chapter 10. Falling Film Vaporizer (Evaporator)</b> . . . . .	253
10.1. General points . . . . .	253
10.1.1. Types of falling film evaporator . . . . .	253
10.1.2. Performance . . . . .	254
10.1.3. Advantages of falling film evaporators . . . . .	255
10.2. Tube wetting . . . . .	256
10.2.1. Minimum linear charge. . . . .	256
10.2.2. Maximum linear load. . . . .	257
10.3. Vapor velocity in the tubes . . . . .	258
10.3.1. Rising current for vapor . . . . .	258
10.3.2. Descending current for vapors . . . . .	260
10.4. Heat transfer . . . . .	260
10.4.1. Partial transfer coefficient: tube side . . . . .	260
10.4.2. Overall transfer coefficient . . . . .	263
10.5. Distribution plate. . . . .	263
10.5.1. Description . . . . .	263
10.5.2. Computerized calculation . . . . .	265
10.5.3. Vapor pressure drop along the tubes . . . . .	267
10.6. Dimensioning an evaporator . . . . .	267
10.6.1. Tube length (preheating a cold feed). . . . .	267
10.6.2. Tube length (vaporization part) . . . . .	268
<b>Chapter 11. Heat Transfer in Stirred Tanks</b> . . . . .	271
11.1. Coil transfer. . . . .	271
11.1.1. General points . . . . .	271
11.1.2. Definition of the coil . . . . .	271
11.2. Coefficient for the reactor wall . . . . .	272
11.2.1. Turbines and paddles . . . . .	272
11.2.2. Marine propeller. . . . .	274
11.2.3. Coil . . . . .	274
11.2.4. Double jacket: internal coefficient . . . . .	275
11.3. Viscous fluids: laminar regime . . . . .	276
11.3.1. Ribbon . . . . .	276
11.3.2. Anchor . . . . .	276
11.4. Thermal conditioning of tanks and reservoirs . . . . .	276
11.4.1. Operating principle . . . . .	276
11.4.2. Heat transfer using a coil. . . . .	277
11.4.3. Heat transfer via the double jacket wall . . . . .	278
11.4.4. Internal configuration. . . . .	279
11.4.5. External configuration . . . . .	281
11.4.6. Mixed configuration . . . . .	282

---

<b>Chapter 12. Cooling or Heating of Simple-form Solids and Plant Products: Blanching</b> . . . . .	285
12.1. Thermal conditioning of simple-form compact solids . . . . .	285
12.1.1. Temperature expressions – theoretical study . . . . .	285
12.1.2. Auxiliary variables . . . . .	290
12.2. Thermal conditioning of simple-form solids: semi-empirical study . . . . .	290
12.2.1. Introduction . . . . .	290
12.2.2. Plates and rectangular parallelepipeds . . . . .	291
12.2.3. Finite or infinite cylinders . . . . .	294
12.2.4. Sphere. . . . .	295
12.3. Thermal conditioning and hydrothermal processing . . . . .	297
12.3.1. Roasting plant products . . . . .	297
12.3.2. Hydrothermal processing of oilseed . . . . .	298
12.3.3. Drying. . . . .	298
12.3.4. Blanching. . . . .	299
<b>Chapter 13. Thermal Insulation of Piping: Tracing</b> . . . . .	301
13.1. Thermal insulation . . . . .	301
13.1.1. Insulation types . . . . .	301
13.1.2. Types of insulation material . . . . .	302
13.1.3. Coefficient for heat loss to the environment . . . . .	303
13.1.4. Heat flow density . . . . .	304
13.1.5. Temperature of the wall in contact with the atmosphere . . . . .	305
13.1.6. Calculating the thickness of insulation . . . . .	305
13.2. Pipe tracing . . . . .	307
13.2.1. Principle . . . . .	307
13.2.2. Heat transfer coefficient . . . . .	307
13.2.3. Practical data . . . . .	310
<b>Chapter 14. Combustion and Sulfur Dew Point</b> . . . . .	313
14.1. Characteristics of combustion . . . . .	313
14.1.1. Combustion air . . . . .	313
14.1.2. Fuel . . . . .	314
14.1.3. Stoichiometric air requirement . . . . .	314
14.1.4. Smoke generation and smoke composition by volume . . . . .	315
14.2. SO <sub>3</sub> content and dew point . . . . .	315
14.2.1. Calculation of the partial pressure of sulfur trioxide . . . . .	315
14.2.2. Calculating the sulfur dew point temperature. . . . .	317

<b>Chapter 15. Heat Supply by Microwave or Infrared Radiation</b> . . . . .	321
15.1. Microwave heating (theory) . . . . .	321
15.1.1. Maxwell's equations . . . . .	321
15.1.2. Energy balance of electromagnetic radiation . . . . .	322
15.1.3. Electric field propagation equation . . . . .	324
15.1.4. Penetration depth in a dielectric layer . . . . .	326
15.1.5. Dielectric conductivity . . . . .	328
15.1.6. Wave impedance . . . . .	330
15.2. Microwave heating (practical) . . . . .	331
15.2.1. Energy consumption and heating time . . . . .	331
15.2.2. Heating power output: runaway . . . . .	332
15.2.3. Transmission coefficients between two dielectrics . . . . .	334
15.2.4. Electric field in the oven and energy flow density . . . . .	335
15.2.5. Practical arrangements and use . . . . .	336
15.3. Infrared drying . . . . .	337
15.3.1. Radiation production . . . . .	337
15.3.2. Absorption of radiation . . . . .	338
15.3.3. Practical data . . . . .	340
<b>Chapter 16. Freezing, Deep-freezing and Thawing</b> . . . . .	341
16.1. Introduction . . . . .	341
16.1.1. Product properties . . . . .	341
16.2. Industrial freezing apparatus . . . . .	342
16.2.1. The deep-freezing principle . . . . .	342
16.2.2. Batch freezer cabinets . . . . .	342
16.2.3. Tunnel freezers . . . . .	342
16.2.4. Continuous blast freezers . . . . .	343
16.2.5. Contact freezing . . . . .	343
16.2.6. Freezing with refrigerant spray . . . . .	343
16.2.7. Deep freezing with refrigerant spray . . . . .	344
16.2.8. Continuous double band freezer . . . . .	344
16.2.9. Fluidized or fixed bed freezers . . . . .	344
16.2.10. Cooling units . . . . .	345
16.2.11. Coolant fluids . . . . .	345
16.2.12. Thermal balance . . . . .	346
16.3. Freezing time (Planck's equation) . . . . .	346
16.3.1. Case of a plate . . . . .	346

---

16.3.2. Case of a sphere . . . . .	347
16.3.3. Generalization I . . . . .	348
16.3.4. Generalization II. . . . .	348
16.3.5. Freezing and thawing times (numerical calculation) . . . . .	349
16.4. Freezing time: practical method . . . . .	349
16.4.1. Introductory note . . . . .	349
16.4.2. Definitions of characteristic dimensions. . . . .	349
16.4.3. Cleland <i>et al's</i> . method (1987) . . . . .	351
16.4.4. Average freezing temperature. . . . .	352
16.4.5. Precooling correction. . . . .	353
16.5. Thawing . . . . .	357
16.5.1. Microwave thawing. . . . .	357
16.5.2. External heating . . . . .	357
16.5.3. Contact heating . . . . .	358
16.5.4. Exudation losses. . . . .	358
16.5.5. Calculating thawing time . . . . .	358
<b>Chapter 17. Freeze-drying . . . . .</b>	<b>359</b>
17.1. General points . . . . .	359
17.1.1. The freeze-drying principle . . . . .	359
17.1.2. Heat supply. . . . .	360
17.1.3. Freeze-drying: implementation . . . . .	361
17.2. Thermodynamics of freeze-drying . . . . .	362
17.2.1. Activity of solvent water in equilibrium with ice . . . . .	362
17.2.2. Empirical expression of water activity for prefreezing. . . . .	364
17.2.3. Expression of enthalpies for freeze-drying . . . . .	367
17.2.4. Conclusion: the freeze-drying process. . . . .	369
17.3. Migration equations . . . . .	370
17.3.1. Free mean path. . . . .	370
17.3.2. Flow through a tube in the Knudsen regime . . . . .	371
17.3.3. Viscosity of a gas . . . . .	372
17.3.4. Migration equations. . . . .	372
17.3.5. Mean pore radius . . . . .	375
17.3.6. Relationship between instantaneous porosity and water content . . . . .	376
17.4. Simulation of freeze-drying . . . . .	377
