Table of Contents

Introduction xiii

PART 1. CARBON PHASES, PRECURSORS AND PARENT COMPOUNDS 1

Chapter 1. A Historical Overview 3

1.1. The alchemy of carbon 3
1.2. Elemental carbon and its allotropic varieties 5
1.3. Novel molecular varieties 7
1.4. Natural forms 9
1.4.1. Carbon: witness of the evolution of the universe 9
1.4.2. Natural carbons from Earth 10
1.4.3. Comparison between natural and artificial carbons 13
1.5. Contribution from quantum mechanics 14
1.5.1. Homonuclear diatomic molecules 14
1.5.2. Curved surfaces: the rehybridization phenomena 16
1.5.3. Presentation of the crystalline forms 17
1.5.4. The isotopes of the carbon atom 19
1.6. Conclusion 21
1.7. Bibliography 21

Chapter 2. Polymorphism of Crystalline Phases 25

2.1. Thermodynamic stability and phase diagram 25
2.1.1. Stable and metastable phases 27
2.1.2. The phase diagram of carbon 28
2.1.3. Case of the molecular phases 32
2.1.4. Crystallographic presentation of usual phases 34
2.2. Classical forms of carbon 37
2.2.1. Cohesive energy and equation of state for solids 37
2.2.2. Structures with a fixed coordination number 39

2.3. Molecular and exotic forms 43
2.3.1. Tri-coordinated structures on curved surfaces 43
2.3.2. Exotic structures with mixed coordination numbers 51
2.4. State of the art and conclusion 53
2.5. Bibliography 54

Chapter 3. Non-Crystalline Carbons 61

3.1. Reminder about defects and imperfections in networks 62
3.1.1. Ideal single crystals 62
3.1.2. Crystalline imperfections 62
3.1.3. Non-crystalline solids 63
3.1.4. Homogenity of a solid 65
3.2. Thermodynamic approach and the classification of solids 70
3.2.1. Generalities 70
3.2.2. Classification of carbon-based materials 72
3.3. Fabrication and characterization techniques 81
3.3.1. Thin-film coating techniques 81
3.3.2. Deposition mechanisms 84
3.3.3. The role of catalysts 89
3.3.4. Characterizations at different scales 91
3.4. Conclusion 92
3.5. Bibliography 93

Chapter 4. Derivative Compounds and Analogs 97

4.1. Doping carbons and solid solutions 98
4.1.1. Doped diamonds 98
4.1.2. Doped graphitic phases 103
4.1.3. Fullerenes and nanotubes doping 108
4.2. 2D and 3D analog compounds 111
4.2.1. Boron nitride 111
4.2.2. Boron carbides 113
4.2.3. Carbon nitrides 113
4.2.4. Carbon-boron nitrides 115
4.3. Similar materials 116
4.3.1. Aggregates and inorganic nanotubes 116
4.3.2. Bulk compounds 117
4.4. Conclusion 118
4.5. Bibliography 118

Chapter 5. From Aromatic Precursors to the Graphene Plane 127

5.1. Condensed polyaromatic systems 128

5.1.1. Presentation of condensed aromatic molecules 128
5.1.2. Thermochemical evolution of organic precursors 136
5.1.3. Association of aromatic molecules and supramolecular organization 141
5.1.4. Structural and physico-chemical characteristics of low temperature carbons 146
5.2. The graphene plane 151
5.2.1. Characteristics and properties. 152
5.2.2. Growth in the vapor phase and thermodynamic stability. 154
5.2.3. Intercalation and exfoliation processes 155
5.3. Current situation and conclusion 160
5.4. Bibliography 160

PART 2. PHYSICAL PROPERTIES OF SOLID CARBONS 169

Chapter 6. General Structural Properties 171

6.1. Elastic and mechanic properties. 172
6.1.1. Reminder of the main definitions 172
6.1.2. Elasticity modulus of crystalline phases 175
6.1.3. Behavior laws relative to bulk polycrystalline graphites 179
6.1.4. Behavior laws for carbon filaments 183
6.2. Thermal properties 188
6.2.1. Thermodynamic definitions. 188
6.2.2. Specific heat 192
6.2.3. Thermal dilatation 197
6.2.4. Thermal conductivity 200
6.3. Conclusion 207
6.4. Bibliography 208

Chapter 7. Electronic Structures and Magnetic Properties 217

7.1. Electronic band structures 218
7.1.1. Band structure of hexagonal graphite single crystals 218
7.1.2. Experimental evaluations of energy parameters 220
7.1.3. Models for graphitic carbons 223
7.1.4. Electronic dimensionality of π solids 225
7.2. Static magnetic properties 227
7.2.1. General presentation of diamagnetism 231
7.2.2. Graphite single crystal and graphene plane. 235
7.2.3. Different varieties of graphitic carbons 238
7.2.4. Quantum phenomena on carbon nanotubes. 240
7.3. Electron spin (or paramagnetic) resonance 240
7.3.1. General characteristics of ESR/EPR. 241

7.3.2. The Pauli paramagnetism of graphites 244
7.3.3. EPR of various carbon varieties 248
7.3.4. Magnetic interactions 251
7.4. NMR 252
7.4.1. Non-crystalline carbons and precursors 253
7.4.2. Case of graphite and related compounds 254
7.5. Conclusion 255
7.6. Bibliography 256

Chapter 8. Electronic Transport Properties 265

8.1. Electrical conductivity 270
8.1.1. Different conduction mechanisms 270
8.1.2. Transport in the ballistic regime 282
8.1.3. Non-ohmic transport and applications 286
8.1.4. Electromechanical properties 292
8.2. Galvanomagnetic properties 293
8.2.1. Evolution of graphitic carbons in classical regime 293
8.2.2. Quantum phenomena in crystalline phases 298
8.2.3. Comparison between different types of graphitic compounds 302
8.3. Thermoelectric properties 305
8.3.1. Graphites and bulk carbons 305
8.3.2. Carbon filaments 307
8.3.3. Thermomagnetic effects 308
8.3.4. Remark on electronic thermal conductivity 309
8.4. Conclusion 310
8.5. Bibliography 310

Chapter 9. Optical Properties and their Applications 321

9.1. Properties in linear optics 325
9.1.1. Experimental techniques and general presentation 325
9.1.2. Single crystal of graphite 329
9.1.3. Graphitic carbons 331
9.1.4. Fullerenes and nanotubes 335
9.1.5. The diamond crystals 338
9.1.6. Adamantine carbons 339
9.2. Nonlinear and photo-induced properties 344
9.2.1. Luminescence in diamond-type phases 345
9.2.2. Photo-induced and nonlinear effects in fullerenes 348
9.2.3. Photo-induced and nonlinear effects in nanotubes 349
9.3. Analysis methods and applications 351
9.3.1. Overview of the relevant techniques 352
9.3.2. Applications in optics and optoelectronics 356

9.4. Conclusion 358
9.5. Bibliography 358

Chapter 10. Vibrational Properties 369

10.1. Phonon spectra in crystalline phases 370
10.1.1. Diamonds 373
10.1.2. Graphite and graphene 374
10.1.3. Nanotubes 378
10.1.4. Carbynes and fullerenes 380
10.1.5. Comparison between elongation modes 381
10.2. Specific characteristics of Raman scattering 383
10.2.1. Raman resonance of graphite 386
10.2.2. Raman resonance of π systems and electron-phonon interactions 387
10.2.3. Influence of structural disorder 389
10.2.4. Characterization of non-crystalline carbons 391
10.3. Data from infrared spectroscopy 394
10.3.1. Thermochemical evolution of carbon-based precursors 396
10.3.2. Analysis of surface functions 398
10.4. Conclusion 399
10.5. Bibliography 400

PART 3. CARBON MATERIALS AND USES 409

Chapter 11. Surface and Interface Phenomena 411

11.1. Physical-chemistry characteristics 412
11.1.1. Surface properties in diamonds and graphites 417
11.1.2. Case of graphitic-type phases 421
11.1.3. Adsorption mechanisms 425
11.2. Electric and electrochemical aspects 429
11.2.1. Double layer model and electrokinetic potential 429
11.2.2. Electronic transfers 432
11.3. Solid interfaces, tribology and mechano-chemical effects 439
11.3.1. Interactions between solid surfaces in motion 440
11.3.2. Grinding of graphitic powder 444
11.3.3. Friction coefficients of diamond phases 445
11.3.4. Friction coefficients of graphitic phases 447
11.3.5. Wear and lubrication 449
11.4. Conclusion 449
11.5. Bibliography 450

Chapter 12. Chemical Reactivity and Surface Treatment 461

12.1. Oxidation reactions 463
12.1.1. Review of the reactions with molecular oxygen 464
12.1.2. Combustion mechanism of various carbons 465
12.1.3. Selectivity between different phases 467
12.1.4. Other gaseous oxidants 468
12.1.5. Oxidation in the liquid phase 471
12.1.6. Oxidations in the solid phase 473
12.1.7. Technical analysis relevant to surface functions 475
12.2. Hydrogenation and halogenation reactions 480
12.2.1. Reactions with hydrogen 480
12.2.2. Reactions with halogens 482
12.3. Surface treatment and heterogenous catalysis 486
12.3.1. Surface modifications 486
12.3.2. Catalytic effects 489
12.4. Conclusion 492
12.5. Bibliography 492

Chapter 13. Divided and Porous Carbons 503

13.1. General presentation of heterogenous carbons 504
13.1.1. Basic classification 504
13.1.2. Carbons from a solid phase 505
13.1.3. Carbons from a liquid phase 510
13.1.4. Porous carbons with a gas phase 511
13.2. Properties of porous carbons 516
13.2.1. Porous textures and surface characteristics 519
13.2.2. Dynamic properties 524
13.3. Competition between chemical reactions and diffusion 533
13.3.1. The Thiele model and its ramifications 533
13.3.2. Chemical deposition in the vapor phase 536
13.3.3. Formation from energetic processes 538
13.4. Conclusion 540
13.5. Bibliography 541

Chapter 14. Carbon Filaments, Composites and Heterogenous Media . . . 553

14.1. Carbon filaments 554
14.1.1. History of nanofilaments 554
14.1.2. Evolution of carbon fibers 559
14.1.3. Main physical characteristics of carbon filaments 562
14.2. Role in composite materials 563
14.2.1. Multidimensional and multiscale systems 564

14.2.2. Fiber-matrix interactions 566
14.2.3. Classes of composites and nanocomposites 570
14.3. Random heterogenous media 572
14.3.1. Electrical conductivity and percolation models 575
14.3.2. Role of interfacial properties and influence of the matrix 577
14.3.3. Consequences of the percolation phenomenon 579
14.4. Conclusion 581
14.5. Bibliography 581

Chapter 15. Use of Carbon Materials 591

15.1. Sensing applications and nanoelectronics 592
15.1.1. Sensors and actuators 593
15.1.2. Nanoelectronic 595
15.2. Carbon for energy 596
15.2.1. Solar radiations, conversion, and heat storage 596
15.2.2. Gas storage 598
15.2.3. Electrochemical storage 599
15.2.4. Carbons in nuclear energy 605
15.3. Thermostructural composites and transport 610
15.3.1. Space applications 611
15.3.2. Braking disks 613
15.4 Carbons for chemistry and environmental problems 615
15.4.1. Applications in industrial chemistry 615
15.4.2. Carbon and environment 617
15.5. Biocarbons 618
15.5.1. Prosthesis and medical implants 618
15.5.2. Biological fluids and hemocompatibility 619
15.5.3. Nanotoxicology 619
15.5.4. Application trends 620
15.6. General conclusion 621
15.7. Bibliography 621

Main Signs and Symbols 631

List of Basic Boxes 634
