Preface	xiii
Chapter 1. Mechanical Characteristics of Divided Solids	1
1.1. Two simple properties	1
1.1.1. The size of particles	1
1.1.2. Compressibility	2
1.2. The mechanics of continuous media	5
1.2.1. Notion of stress in a solid	5
1.2.2. Equilibrium of forces and tensor of the stresses in plane coordinates	6
1.2.3. Equilibrium of forces of volume and of moments: stress tensor symmetry	8
1.2.4. Principal directions and eigenvectors	8
1.2.5. Mohr's circles in three dimensions	9
1.2.6. Two-dimensional case	11
1.2.7. Three-dimensional mechanics with symmetry plane	14
1.2.8. Displacement laws	15
1.3. Flow of divided solids	16
1.3.1. Preconditioning and critical condition.	16
1.3.2. Experimental results if $\sigma_c \neq \sigma_c^*$	17
1.3.3. Trial procedure according to Jenike	21
1.3.4. Rational evolution of consolidation	22
1.3.5. Hysteresis	22
1.3.6. Interpretation of results: non-confined yield stress	23
1.3.7. Flowability and flow coefficient	25
1.3.8. Rigidity, plasticity, flowability, and mobility	28
1.3.9. Energy dissipation	30

1.3.10. Analytical expression of rupture regions	30
1.3.11. Influencing parameters on the friction angles	32
1.4. Current identities	34
1.4.1. Relationship between the principal stresses and the unconfined stress	34
1.4.2. Other current identities.	35
1.4.3. Friction angle on a surface	38
1.4.4. Sliding on a vertical wall: active and passive states.	42
1.5. Measurement of the mechanical properties of divided solids.	45
1.5.1. Consolidation stress	45
1.5.2. Measurement of displacements as a function of stresses.	46
1.5.3. Measurement of the limit shear stress for shear displacement.	47
1.5.4. Measurement of the surface area and the true (intrinsic) mass density of a divided solid	48
1.6. Stockpiling	48
1.6.1. Angle of repose (also called “natural embankment angle”).	48
1.6.2. Practical values of the angle of repose	50
1.6.3. Importance of pile storage.	50
1.6.4. Importance of the study of free surfaces and underlying stresses	51
1.6.5. Stresses on free surfaces.	51
1.6.6. Principal stresses under a horizontal free surface	52
1.6.7. Active and passive states	52
Chapter 2. Stresses in Hoppers and Silos: Filling, Emptying and Content Homogeneity	57
2.1. Stresses on the walls	57
2.1.1. The two states of stress	57
2.1.2. Resulting sign conventions	58
2.1.3. Janssen’s equations for a vertical cylindrical wall.	59
2.1.4. Average stress on the cylindrical wall.	62
2.1.5. Expression of parameters according to the state of stresses (cylindrical section)	62
2.1.6. Supporting reaction exerted by the wall (cylindrical part)	63
2.1.7. Study of the convergent: simplifying assumption	64

2.1.8. Supporting reaction exerted by the wall (convergent)	69
2.1.9. Rotation of the principal stresses to the cylinder–convergent transition.	70
2.1.10. Inclined wall	71
2.1.11. “Holding” reaction of the product on the walls of the convergent	73
2.1.12. Existence of the active state in the convergent	74
2.1.13. Weakness of the wall to the cone-cylinder junction	76
2.1.14. Weakness in the previous considerations	78
2.2. Variation in the stresses with ensiling and desiling. Homogeneity, heterogeneity of content.	79
2.2.1. Homogeneity and flowability of silage	79
2.2.2. Importance of the properties of the product	81
2.2.3. Filling modes	81
2.2.4. Characteristics of loading of a capacity	82
2.2.5. Filling by jet (of granules) and localized over pressures	82
2.2.6. Homogeneous ensiling and heterogeneous ensiling.	83
2.2.7. Homogeneous ensiled mass (slow and rainwise filling)	84
2.2.8. Heterogeneous ensiled mass (quick fill and, for the granules, in a jet)	85
Chapter 3. Draining of Hoppers and Silos: Stresses and Flow Rate	89
3.1. General information	89
3.1.1. Specific investment.	89
3.1.2. Methods of ensiling (of capacity filling)	90
3.1.3. Instruments for the measurement of the level of the product.	90
3.1.4. What is a hopper or a silo?	91
3.1.5. Silos with multiple outlets.	92
3.2. Flow types and flow regimes	92
3.2.1. Types of flow	92
3.2.2. Mass flow regimes depending on the product	93
3.2.3. Flow character according to the configuration of the convergent	95
3.3. Criteria for mass flow.	95
3.3.1. Importance of capacities without dead zones	95
3.3.2. Criteria for mass flow (active state of the stresses)	96
3.3.3. Limited active type domain – angle of approach	97

3.3.4. Conditions for mass flow (passive state of the stresses)	98
3.3.5. Jenike's criteria for the existence of a desilage well (emptying).	101
3.4. Flow with dead zone	102
3.4.1. Dead zones: features and disadvantages	102
3.4.2. Conditions for complete drainage – adherence in the convergent.	103
3.4.3. Edge's slope with interior corners	104
3.4.4. Capacities with permanent dead zones	105
3.4.5. Operation of a permanent dead zone capacity without segregation.	106
3.4.6. Persistence of the dead zone during the flow.	106
3.4.7. Practical data	110
3.4.8. Angle of approach and angle of convergence	111
3.4.9. Configuration of the well (angle of approach and diameter)	112
3.5. Arching or doming and its prevention	114
3.5.1. Minimum size of the discharge outlet	114
3.5.2. Graphical procedure	118
3.5.3. Slenderness of a silo and arching.	121
3.5.4. Stresses in a downward convergent	122
3.5.5. Characteristic ratios and condition for flow without interruption	123
3.6. Rate of emptying.	124
3.6.1. Rate of mass drainage	124
3.6.2. Johanson's expression for the rate of emptying	127
3.6.3. Effect of the product on the parameters of mass desilage flow rate.	128
3.6.4. Effect of the diameter of particles on the flow rate	129
3.6.5. Small-sized circular opening	130
3.6.6. Effect of the roughness of the wall of the convergent on the flow rate	131
3.6.7. Effect of air pressure	132
3.7. Withdrawal of fine products	132
3.7.1. Mass flow mechanism of fine products	132
3.7.2. Permeability, specific resistance, and law of percolation	132
3.7.3. Compactness of confined dispersion in free fall	134
3.7.4. Flow rate of solid retarded by the rise of air	135
3.7.5. Drop in gas pressure above the opening.	136
3.7.6. Powders and their permeability to gases	139

3.7.7. Flow of fine products with the presence of a well	140
3.8. The kinematic theory of flow in a hopper	141
3.8.1. Flow in a vertical cylinder.	141
3.8.2. Flow in a vertical convergent	141
3.8.3. Advantages of the kinematic theory	142
3.9. Activation of the emptying.	143
3.9.1. Activation by vibrations	143
3.9.2. Flow promoter slabs (vibrated or nonvibrated)	143
3.9.3. Air injection and angle at the tip of the convergent	145
3.9.4. Forced emptying	146
3.9.5. Destabilization of the arch or dome by air knocker	147
3.9.6. Destabilization of the arch by airbags	147
3.9.7. Other systems without vibration	147
3.10. Caking	148
3.10.1. Caking (massification)	148
3.10.2. Prevention of caking: coaters	150
Chapter 4. Mechanics of Divided Solids	153
4.1. Static limit of divided solids: method of characteristics.	153
4.1.1. Equation of the field of stresses	153
4.1.2. Total derivatives of β and p	155
4.1.3. Characteristic curves and their equations.	157
4.2. The dynamic of D.S. according to Bagnold	160
4.2.1. A divided solid subjected to a pure shear.	160
4.3. Dynamics of divided solids: method of discrete elements (of distinct particles)	161
4.3.1. Presentation	161
4.3.2. Contact between two particles	162
4.3.3. Intersparticle friction according to Cundall and Strack	166
4.3.4. Forces of interaction between two particles	167
4.3.5. Movement at the contact point between two particles i and j	168
4.3.6. Damping	170
4.3.7. Moment of inertia of a sphere	171
4.3.8. Value of the increment in time	171
4.3.9. Selection of influential particles on a particle	173
4.3.10. More economical study of significant couples	174
4.3.11. Coefficient of restitution.	175
4.3.12. Calculation of k and c	176
4.3.13. Flow on an inclined plane by the method of discrete elements	177

4.4. Surface dynamics of a D.S.	179
4.4.1. Bouchaud <i>et al.</i> 's equation simplified by de Gennes	179
4.4.2. Application of de Gennes' equation	180
4.4.3. Side of a layer of D.S. analytical study	181
4.5. Experimental studies	182
Chapter 5. Densification of Powders: Tablets and Granules	183
5.1. Useful properties of powders for pressing	183
5.1.1. History (pharmaceutical powders)	183
5.1.2. Industrial powders (conditioning)	184
5.1.3. Flowability of a powder	184
5.1.4. Vickers hardness of a crystal	186
5.1.5. Mohs' scale for minerals	187
5.1.6. Hiestand and Smith's indices	187
5.2. The pressing operation of powders	188
5.2.1. Sintering mechanism under pressure	188
5.2.2. Useful additives to the pressing of tablets	189
5.2.3. Diluents.	190
5.2.4. Excipients	190
5.2.5. Description of the formation of a tablet	191
5.2.6. Pressing operation	192
5.2.7. Resistance of a tablet to crushing	195
5.2.8. Distortion due to compression	196
5.2.9. Compression presses	196
5.2.10. Granulation by pressing	197
5.2.11. Shaping of balls by compression	198
5.2.12. Agglomeration by rapid agitation.	198
5.3. The physics of rolling-granulation	198
5.3.1. Advantages of grains over powders	198
5.3.2. States of moist divided solids.	199
5.3.3. Capillary adhesion of a particle on a moist granulated product	199
5.3.4. Steps in the formation of pellets by rolling.	200
5.3.5. Humidification	202
5.3.6. Effect of drying	203
5.3.7. Effect of granulometry and porosity	203
5.3.8. Kinetics of continuous granulation.	204
5.3.9. Expression for the rupture-coalescence velocity.	206
5.4. Granulating equipment	208
5.4.1. Drum	208

5.4.2. Operating parameters of the drum	209
5.4.3. Plate.	210
5.4.4. Comparison between drum and plate	211
5.4.5. Dynamic elements of divided solids	212
5.5. Resistance of the granular	213
5.5.1. Deformation due to tensile strain.	213
5.5.2. Effect of saturation on σ_{\max}	214
5.5.3. Cohesion of pellets	214
5.5.4. Tensile strength of capillary origin	215
5.5.5. Van der Waals forces.	217
5.5.6. Tensile strength exerted by van der Waals forces	218
5.5.7. Formation of a solid bridge between particles	219
5.5.8. Effect of granulometric distribution	220
5.5.9. Conclusion.	221
Chapter 6. Mechanics and Thermics of Gaseous Fluidized Beds	223
6.1. Mechanics of gaseous fluidized beds.	223
6.1.1. Mechanism of fluidization	223
6.1.2. Formation of bubbles.	225
6.1.3. Distributor design.	226
6.1.4. Classification of particles	226
6.1.5. Coefficient of geometric sphericity of the particles	228
6.1.6. Practical sphericity	229
6.1.7. Average volume area.	230
6.2. Flow thresholds	230
6.2.1. Porosity at the incipient fluidization.	230
6.2.2. Incipient fluidization velocity.	231
6.2.3. Incipient bubbling velocity	233
6.3. Morphology of a fluidized bed	235
6.3.1. Expansion of a homogenous fluidized bed (without bubbles)	235
6.3.2. Expansion of the bubbling bed	236
6.3.3. Morphology of a bubble	237
6.3.4. Diameter of bubbles	238
6.3.5. Rate of climb of an isolated bubble	239
6.3.6. Velocity of the bubbles at a given point of a fluidized bed	240
6.3.7. Movement of the solid in the fluidized bed.	242
6.3.8. Liberation height of the gas	242

6.3.9. Calculation of downcomers for superimposed fluidized beds	243
6.3.10. The turbulent bed	243
6.3.11. The circulating fluidized bed (transported or rapid)	244
6.4. Plugging.	245
6.4.1. Conditions for plugging	245
6.4.2. Height of the bed in a plugging (pulsating) regime	247
6.4.3. Fall in pressure across a bed in the swabbing regime	248
6.5. Heat transfer	249
6.5.1. Thermal properties of some solid materials	249
6.5.2. Equivalent thermal conductivity of the fluidized bed.	249
6.5.3. Heat transfer (by convection) across a vertical surface	251
6.5.4. Heat transfer between a fluidized bed and a vertical tube	255
6.5.5. Heat transfer between the fluidized bed and a horizontal tube	256
6.5.6. Heat transfer by radiation	258
6.6. Applications of fluidization	259
Appendices	261
Appendix 1. Apparent Mass Density of Bulk Divided Solids (kg.m^{-3})	263
Appendix 2. Simple Results of Analytical Geometry	265
Appendix 3. Mohs' Scale	269
Bibliography	273
Index	291
