

Table of Contents

Preface	xi
Chapter 1. Faults in Electrical Machines and their Diagnosis.	1
Sadok BAZINE and Jean-Claude TRIGEASSOU	
1.1. Introduction	1
1.2. Composition of induction machines	3
1.2.1. The stator	4
1.2.2. The rotor	4
1.2.3. Bearings	5
1.3. Failures in induction machines	5
1.3.1. Mechanical failures	8
1.3.2. Electrical failures	9
1.4. Overview of methods for diagnosing induction machines	10
1.4.1. Diagnosis methods using an analytical model	12
1.4.2. Diagnostic methods with no analytical model	16
1.5. Conclusion	18
1.6. Bibliography	19
Chapter 2. Modeling Induction Machine Winding Faults for Diagnosis	23
Emmanuel SCHAEFFER and Smail BACHIR	
2.1. Introduction	23
2.1.1. Simulation model versus diagnosis model	23
2.1.2. Objectives	24
2.1.3. Methodology	24
2.1.4. Chapter structure	25
2.2. Study framework and general methodology	26
2.2.1. Working hypotheses	26

2.2.2. Equivalence between winding systems	27
2.2.3. Equivalent two-phase machine with no fault	34
2.2.4. Consideration of a stator winding fault	37
2.3. Model of the machine with a stator insulation fault	40
2.3.1. Electrical equations of the machine with a stator short-circuit	40
2.3.2. State model in any reference frame	43
2.3.3. Extension of the three-phase stator model	47
2.3.4. Model validation	48
2.4. Generalization of the approach to the coupled modeling of stator and rotor faults	51
2.4.1. Electrical equations in the presence of rotor imbalance	53
2.4.2. Generalized model of the machine with stator and rotor faults	55
2.5. Methodology for monitoring the induction machine	57
2.5.1. Parameter estimation for induction machine diagnosis	58
2.5.2. Experimental validation of the monitoring strategy	61
2.6. Conclusion	64
2.7. Bibliography	67
Chapter 3. Closed-Loop Diagnosis of the Induction Machine	69
Imène BEN AMEUR BAZINE, Jean-Claude TRIGEASSOU, Khaled JELASSI and Thierry POINOT	
3.1. Introduction	69
3.2. Closed-loop identification	71
3.2.1. Problems in closed-loop identification	71
3.2.2. Identification problems for diagnosing electrical machines	73
3.3. General methodology of closed-loop identification of induction machine	74
3.3.1. Taking control into account	74
3.3.2. Machine identification by closed-loop decomposition	76
3.3.3. Identification results	80
3.4. Closed-loop diagnosis of simultaneous stator/rotor faults	82
3.4.1. General model of induction machine faults	82
3.4.2. Parameter estimation with a priori information	83
3.4.3. Detection and localization.	84
3.4.4. Comparison of identification results through direct and indirect approaches	87
3.5. Conclusion	89
3.6. Bibliography	90

Chapter 4. Induction Machine Diagnosis Using Observers	93
Guy CLERC and Jean-Claude MARQUES	
4.1. Introduction	93
4.2. Model presentation	96
4.2.1. Three-phase model of induction machine without fault	96
4.2.2. Park's model of an induction machine without fault	100
4.2.3. Induction machine models with fault	104
4.3. Observers	104
4.3.1. Principle	104
4.3.2. Different kinds of observers.	108
4.3.3. Extended observer	115
4.4. Applying observers to diagnostics	119
4.4.1. Using Park's model	119
4.4.2. Use of the three-phase model	124
4.4.3. Spectral analysis of the torque reconstructed by the observer	125
4.5. Conclusion	127
4.6. Bibliography	128
 Chapter 5. Thermal Monitoring of the Induction Machine	 131
Luc LORON and Emmanuel FOULON	
5.1. Introduction	131
5.1.1. Aims of the thermal monitoring on induction machines	131
5.1.2. Main methods of thermal monitoring of the induction machines	133
5.2. Real-time parametric estimation by Kalman filter	137
5.2.1. Interest and specificities of the Kalman filter	137
5.2.2. Implementation of an extended Kalman filter	138
5.3. Electrical models for the thermal monitoring	142
5.3.1. Continuous time models	143
5.3.2. Full-order model	144
5.3.3. Discretized and extended model	147
5.4. Experimental system	149
5.4.1. General presentation of the test bench.	149
5.4.2. Thermal instrumentation.	151
5.4.3. Electrical instrumentation	153
5.5. Experimental results	157
5.5.1. Tuning of the Kalman filter	157
5.5.2. Influence of the magnetic saturation	160
5.6. Conclusion	162
5.7. Appendix: induction machine characteristics	163
5.8. Bibliography	163

Chapter 6. Diagnosis of the Internal Resistance of an Automotive Lead-acid Battery by the Implementation of a Model Invalidation-based Approach: Application to Crankability Estimation	167
Jocelyn SABATIER, Mikaël CUGNET, Stéphane LARUELLE, Sylvie GRUGEON, Isabelle CHANTEUR, Bernard SAHUT, Alain OUSTALOUP and Jean-Marie TARASCON	
6.1. Introduction	167
6.2. Fractional model of a lead-acid battery for the start-up phase	169
6.3. Identification of the fractional model.	171
6.3.1. Output error identification algorithm	171
6.3.2. Calculation of the output sensitivities	173
6.3.3. Validation of the estimated parameters	174
6.3.4. Application to start-up signals	174
6.4. Battery resistance as crankability estimator	175
6.5. Model validation and estimation of the battery resistance	178
6.5.1. Frequency approach of the model validation	178
6.5.2. Application to the estimation of the battery resistance	181
6.5.3. Simplified resistance estimator	184
6.6. Toward a battery state estimator	188
6.7. Conclusion	188
6.8. Bibliography	190
Chapter 7. Electrical and Mechanical Faults Diagnosis of Induction Machines using Signal Analysis	193
Hubert RAZIK and Mohamed EL KAMEL OUMAAMAR	
7.1. Introduction	193
7.2. The spectrum of the current line	194
7.3. Signal processing	196
7.3.1. Fourier's transform	196
7.3.2. Periodogram	197
7.4. Signal analysis from experiment campaigns	199
7.4.1. Disturbances induced by a broken bar	199
7.4.2. Bearing faults	205
7.4.3. Static eccentricity	211
7.4.4. Inter turn short circuits	220
7.5. Conclusion	222
7.6. Appendices	223
7.6.1. Appendix A	223
7.6.2. Appendix B	223
7.7. Bibliography	224

Chapter 8. Fault Diagnosis of the Induction Machine by Neural Networks	227
Monia Ben Khader BOUZID, Najiba MRABET BELLAAJ, Khaled JELASSI, Gérard CHAMPENOIS and Sandrine MOREAU	
8.1. Introduction	227
8.2. Methodology of the use of the ANN in the diagnostic domain	228
8.2.1. Choice of the fault indicators	229
8.2.2. Choice of the structure of the network	230
8.2.3. Construction of the learning and test base	231
8.2.4. Learning and test of the network	232
8.3. Description of the monitoring system	232
8.4. The detection problem	233
8.5. The proposed method for the robust detection	235
8.5.1. Generation of the estimated residues	236
8.6. Signature of the stator and rotor faults	237
8.6.1. Analysis of the residue in healthy regime.	237
8.6.2. Analysis of the residue in presence of the stator fault	237
8.6.3. Analysis of the residue in presence of the rotor fault	241
8.6.4. Analysis of the residue in presence of simultaneous stator/rotor fault	244
8.7. Detection of the faults by the RN_d neural network	244
8.7.1. Extraction of the fault indicators	244
8.7.2. Learning sequence of the RN_d network	245
8.7.3. Structure of the RN_d network	246
8.7.4. Results of the learning of the RN_d network	247
8.7.5. Test results of the RN_d network	248
8.8. Diagnosis of the stator fault	251
8.8.1. Choice of the fault indicators for the RN_{cc} network	251
8.8.2. Learning sequence of the RN_{cc} network	253
8.8.3. Structure of the RN_{cc} network	254
8.8.4. Learning results of the RN_{cc} network	255
8.8.5. Results of the test of the RN_{cc} network	256
8.8.6. Experimental validation of the RN_{cc} network	259
8.9. Diagnosis of the rotor fault.	263
8.9.1. Choice of the fault indicators of the RN_{bc} network	265
8.9.2. Learning sequence of the RN_{bc} network	265
8.9.3. Learning, test and validation results	266
8.10. Complete monitoring system of the induction machine	267
8.11. Conclusion	268
8.12. Bibliography	269

Chapter 9. Faults Detection and Diagnosis in a Static Converter	271
Mohamed BENBOUZID, Claude DELPHA, Zoubir KHATIR, Stéphane LEFEBVRE and Demba DIALLO	
9.1. Introduction	271
9.2. Detection and diagnosis	273
9.2.1. Neural network approach	273
9.2.2. A fuzzy logic approach	280
9.2.3. Multi-dimensional data analysis	285
9.3. Thermal fatigue of power electronic moduli and failure modes	294
9.3.1. Presentation of power electronic moduli in diagnosis	294
9.3.2. Causes and main types of degradation of power electronics moduli	304
9.3.3. Interconnection degradation effects on electrical characteristics and potential use for diagnosis	310
9.3.4. Effects of interface degradation on thermal characteristics and potential use for diagnosis	313
9.4. Conclusion	316
9.5. Bibliography	316
List of Authors	321
Index	327
