Table of Contents

Foreword xiii

Chapter 1. Introduction to Fatigue: Fundamentals and Methodology . . . 1
André PINEAU and Claude BATHIAS

1.1. Introduction to the fatigue of materials 1
1.1.1. Brief history of fatigue: its technical and scientific importance . . . 1
1.1.2. Definitions 6
1.1.3. Endurance diagrams 8
1.2. Mechanisms of fatigue damage 10
1.2.1. Introduction/background. 10
1.2.2. Initiation of fatigue cracks. 10
1.2.3. Propagation of fatigue cracks 12
1.3. Test systems 13
1.4. Structural design and fatigue. 15
1.5. Fatigue of polymers, elastomers and composite materials 16
1.6. Conclusion 18
1.7. Bibliography 19

Chapter 2. Modeling of Fatigue Strength and Endurance Curve 23
Henri-Paul LIEURADE

2.1. Introduction. 23
2.2. Nature and aspect of the scatter of fatigue test results 25
2.3. Determination of the endurance limit 27
2.4. Estimation methods of fatigue resistance and standard deviation with *N* cycles 27
2.4.1. Probit method 28
2.4.2. Staircase method 33
2.4.3. Iteration method. 36

2.4.4. Non-failed specimen method 41
2.4.5. Choice of test method 46
2.5. Mathematical representations and plotting methods of the Wöhler curve 47
2.5.1. Introduction 47
2.5.2. Mathematical representation of the Wöhler curve. 48
2.5.3. Adjustment methods of a Wöhler curve to test results 53
2.6. Estimation of the cycle number N for a given level of stress amplitude 55
2.6.1. Principle 57
2.6.2. Set-up 57
2.6.3. Application 58
2.7. Influence of mechanical parameters on endurance 59
2.7.1. Influence of the mean stress. 59
2.7.2. Influence of the nature of forces 60
2.8. Relationship between endurance and mechanical characteristics (of steels) 62
2.8.1. Estimations of σ_D 62
2.8.2. Estimation of standard deviations 65
2.8.3. Conclusion 65
2.9. Bibliography 66

Chapter 3. Fatigue Crack Initiation 69
Paul RABBE and Louis ANQUEZ

3.1. Introduction. 69
3.2. Physical mechanisms of crack initiation 70
3.2.1. Three stages of fatigue failure: a reminder 70
3.2.2. Influence of stress amplitude 72
3.3. Methods of evaluating crack initiation 81
3.3.1. Smooth specimens 81
3.3.2. Notch effect 83
3.4. Practical method of structure calculation 97
3.4.1. Preliminary 97
3.4.2. The problem to be solved 99
3.4.3. Initiation parameters 100
3.4.4. The master Wöhler curve ($k_t = 1$) 101
3.4.5. Cumulative damage ($k_t = 1$). 103
3.4.6. Specimens with $k_t > 1$: correspondence curve 104
3.4.7. Use of correspondence curves 107
3.4.8. Plotting the correspondence curves 107
3.4.9. Comments and conclusion 108
3.5. Bibliography 109

Chapter 4. Low-cycle Fatigue 113
André PINEAU

4.1. Introduction 113
4.1.1. Application domain of low cycle plastic fatigue 113
4.1.2. General description of the test methods: main issues 116
4.2. Phenomenological description of low-cycle fatigue 122
4.2.1. Background 122
4.2.2. Cyclic work hardening 122
4.2.3. Cyclic stress-strain relationships 125
4.2.4. Fatigue strength 129
4.2.5. Mathematical equations 130
4.2.6. General behavior: sequence effects and control mode 133
4.3. Adaptation mechanism and cracking during low-cycle fatigue 134
4.3.1. Introduction 134
4.3.2. Adaptation of the material 135
4.3.3. Description and elementary interpretation of the adaptation stage within structural alloys: steels 151
4.3.4. Crack initiation in LCF 164
4.3.5. Crack propagation in LCF 169
4.4. Conclusion 172
4.5. Acknowledgements 172
4.6. Bibliography 173

Chapter 5. Gigacycle Fatigue 179
Claude BATHIAS

5.1. Introducing the real-life fatigue life of machines 179
5.2. Testing process 181
5.2.1. Piezoelectric machines 181
5.2.2. Principle of vibratory fatigue 181
5.2.3. Calculation of resonance lengths 184
5.2.4. Calculation of the specimens 184
5.2.5. Calculation of the sonotrodes 186
5.3. Systems of piezoelectric fatigue machines 188
5.4. SN curves above 10^7 cycles 190
5.4.1. General aspects of SN curves 190
5.4.2. Case of ferrous metals 193
5.4.3. Case of aluminum alloys 208
5.5. Initiation mechanism under gigacycle fatigue 209
5.5.1. Non-metallic inclusions 210
5.5.2. Metallurgic defects within the matrix 211
5.5.3. Microporosities 211

5.6. Assessing fatigue strength 219
5.6.1. Comparison between the staircase, Bastenaire, Wöhler, Basquin and Stromeyer/linear methods 219
5.6.2. Kitawaga diagram under gigacycle fatigue 221
5.6.3. Assessment of initiation fatigue life using the ITMA model and Paris-Hertzberg law 222
5.6.4. Prediction of fatigue strength using the Murakami model 225
5.7. Conclusion 226
5.8. Bibliography 226

Chapter 6. Fatigue Crack Growth Laws 231
Jacques MASOUNAVE, Jean-Paul BAÏLON and John-Ivan DICKSON

6.1. Introduction 231
6.2. Models describing crack propagation 232
6.2.1. Phenomenological models 232
6.2.2. Models based on dislocation theory 237
6.2.3. Models based on the behavior of a material at the crack-tip 241
6.2.4. Models based on the cyclic properties of the material 244
6.3. Critical evaluation of the models 249
6.3.1. Influence of the parameters of cyclic behavior 249
6.3.2. Equations between m and C 252
6.3.3. Influences of the intrinsic parameters on cracking 254
6.3.4. Influence of the parameters extrinsic to cracking 256
6.4. Future plans 258
6.5. Conclusion 260
6.5.1. Metallurgic parameters 260
6.5.2. Extrinsic parameters 261
6.6. Bibliography 261

Chapter 7. Short Crack Propagation 269
Yves VERREMAN

7.1. Introduction 269
7.2. Theoretical considerations showing the limits of LEFM 271
7.2.1. Propagation of cracks from a smooth edge: Kitagawa diagram . . . 271
7.2.2. Propagation of cracks from a macroscopic notch root: Frost diagram 273
7.3. Experimental observations 275
7.3.1. Propagation rates of short cracks 275
7.3.2. Microstructurally short cracks 277
7.3.3. Mechanically short cracks 280
7.4. Role of closure in the behavior of short cracks 285
7.4.1. Closure of fatigue cracks 285

7.4.2. Development of the closure of short cracks 287
7.4.3. Correlation between propagation rates and ΔK_{eff} 289
7.4.4. Roughness-induced crack closure 290
7.5. Modeling of the behavior of short cracks 291
7.5.1. Modeling of microstructurally short cracks 291
7.5.2. Modeling of mechanically short cracks 296
7.6. Conclusion 302
7.7. Acknowledgements 303
7.8. Bibliography 303

Chapter 8. Plastic Deformation Mechanisms at the Crack Tip 311
Claude BATHIAS

8.1. Introduction 311
8.2. Fatigue plastic deformation at the crack tip 312
8.2.1. Theoretical aspect 312
8.2.2. Experimental trials 318
8.2.3. Crystallographic aspects 320
8.3. Microfractographic aspects of the fatigue crack 323
8.3.1. Fractographic observations 323
8.3.2. Mechanisms of striation formation 324
8.4. Model based on displacement on crack tip opening 328
8.5. Cyclic stress hardening at the crack tip 331
8.6. Model based on the effective stress intensity factor 334
8.6.1. Elber's model 334
8.6.2. Application of Elber's model 336
8.6.3. Interpretation of the fundamental mechanisms 337
8.7. Conclusion 342
8.8. Bibliography 343

Chapter 9. Local Approach to Fatigue Crack Growth 347
Sylvie POMMIER

9.1. Introduction 347
9.2. Plasticity at the crack tip 348
9.2.1. Irwin's plastic zones 348
9.2.2. T-Stress effect 351
9.2.3. Role of strain hardening of the material 352
9.3. Cyclic plasticity at the crack tip 355
9.3.1. Cyclic elastic-plastic behavior of the material 355
9.3.2. Plasticity induced history effect in fatigue crack growth 357
9.4. Local approach to fatigue crack growth 366
9.4.1. Approach 366

9.4.2. Scale-up method 367
9.4.3. Application 370
9.4.4. Extensions 372
9.5. Conclusion 372
9.6. Bibliography 373

Chapter 10. Corrosion Fatigue 377
Régis PELLOUX and Jean-Marc GENKIN

10.1. Introduction 377
10.2. Crack initiation 378
10.2.1. Aqueous medium 378
10.2.2. Gaseous environment 383
10.3. Short cracks 384
10.4. Long crack propagation 385
10.4.1. Experimental observations 385
10.4.2. Corrosion fatigue models 393
10.5. Conclusions 397
10.6. Bibliography 397

Chapter 11. Effect of Environment 401
Jean PETIT and Christine SARRAZIN-BAUDOUX

11.1. Introduction 401
11.2. Effect of environment on lifetime under high-cycle fatigue conditions 403
11.2.1. Initial work 403
11.2.2. Mechanisms 404
11.2.3. Influence of atmospheric pressure and frequency 407
11.2.4. Combined effects of microstructure and environment 408
11.2.5. Effects of combining temperature and environment 409
11.2.6. Effect of the environment under ultra high-cycle fatigue conditions 410
11.3. Influence of the environment on fatigue crack propagation 411
11.3.1. Initial work 411
11.3.2. Propagation of fatigue cracks under a vacuum (inert reference environment) 415
11.3.3. Environmentally-assisted propagation 421
11.3.4. Cracking path 427
11.3.5. Influence of different factors 431
11.4. Conclusion 443
11.5. Bibliography 444

Chapter 12. Fatigue under Variable Amplitude Loadings 457
Thierry PALIN-LUC

12.1. Introduction 457
12.2. Variable amplitude loadings 460
12.2.1. Why should we carry out fatigue tests under variable amplitude loadings? 460
12.2.2. Characterization of loading signals and terminology 464
12.2.3. From in service recordings to test spectra 467
12.3. Fatigue tests under variable amplitude loadings 478
12.3.1. General methodology of the simulation tests 478
12.3.2. Test benches 478
12.3.3. Block-program tests 478
12.3.4. Variable amplitude fatigue tests and spectra 480
12.3.5. Tests under random loading 482
12.3.6. Representation of the test results 483
12.4. Factors influencing the test results under variable amplitude loading . 486
12.4.1. Counting method used to build the sequence 486
12.4.2. Number of loading levels 486
12.4.3. Application order of the loading levels 487
12.4.4. Loading frequency 488
12.4.5. Limitation of the signals under high stresses 488
12.4.6. Irregularity factor 488
12.4.7. Type of spectrum 489
12.4.8. “Small cycles” or cycles with low amplitude 490
12.4.9. Accelerated fatigue tests 490
12.5. Fatigue lifetime assessment under variable amplitude loading 493
12.5.1. Main methodology 493
12.5.2. Characteristics of multiaxial loading 495
12.5.3. Towards no cycle counting 496
12.6. Conclusion 497
12.7. Bibliography 498
