FOREWORD	xi
Patrick GÉLARD	
LIST OF ACRONYMS	xiii
INTRODUCTION	xxiii
CHAPTER 1. SATELLITE AND TERRESTRIAL HYBRID NETWORKS	1
1.1. Designing satellite and terrestrial hybrid networks	1
1.2. Hybrid scenarios	2
1.2.1. Network architecture: integration of hybrid networks	4
1.2.2. Tight coupling integration: an integrated approach	5
1.2.3. Gateway integration	7
1.2.4. Loose coupling integration	8
1.3. Case study: loose coupling integration	9
1.3.1. Use case and user profile	9
1.3.2. Proposal of a scenario	9
1.3.3. Profile of mobile users	11
1.4. Conclusion	12
CHAPTER 2. QUALITY OF SERVICE ON NEXT-GENERATION TERRESTRIAL NETWORKS	15
2.1. IETF approach	16
2.1.1. Network level	16
2.1.2. Transport level	29
2.1.3. Session and application levels	32
2.1.4. QoS signaling	37

2.2. ITU-NGN approach	45
2.2.1. Principles	45
2.2.2. Transport stratum	47
2.2.3. Service stratum	49
2.2.4. Management plan	50
2.3. Conclusion	50
CHAPTER 3. QUALITY OF SERVICE IN DVB-S/RCS SATELLITE NETWORKS	53
3.1. Bi-directional satellite access systems	54
3.1.1. Overview	54
3.2. The DVB-S standard and the IP support	59
3.2.1. The DVB-S standard	60
3.2.2. Access method	63
3.2.3. IP encapsulation method over DVB-S	63
3.3. The DVB-S2 standard	67
3.3.1. Coding and modulations	67
3.3.2. Encapsulation	69
3.4. The DVB-RCS standard	70
3.4.1. Access method: MF-TDMA	71
3.4.2. Signaling in a DVB-RCS/S System	74
3.4.3. Connections	78
3.5. DVB-RCS2	79
3.5.1. Coding and modulation	79
3.5.2. Access techniques	79
3.5.3. Encapsulation	80
3.5.4. QoS architecture and PEP	80
3.6. QoS architecture in DVB-S/RCS satellite access networks	80
3.6.1. The various stakeholders in the satellite network	81
3.6.2. The SatLabs architectural model	82
3.6.3. The BSM architectural model based on IP	89
3.7. Conclusion	96
CHAPTER 4. INTEGRATION OF SATELLITES INTO IMS QoS ARCHITECTURE	97
4.1. IMS architecture	97
4.1.1. COPS and DIAMETER messages	99
4.2. IMS QoS architecture	100
4.2.1. IMS QoS in a GPRS: UMTS network	103
4.2.2. IMS QoS in an asymmetric digital subscriber line (ADSL) network	106
4.3. IMS QoS signaling	107

4.3.1. Authorization of QoS resources	108
4.3.2. Reservation of QoS resources with a local service policy	110
4.3.3. Approval of commitments of authorized resources	110
4.3.4. Deleting commitments of authorized resources	112
4.3.5. Revocation of a QoS resource authorization	112
4.3.6. Indication of a PDP context deletion	113
4.3.7. Authorization for the modification of the PDP context.	115
4.4. Inclusion of IMS QoS in the satellite segment	116
4.4.1. “System” hypothesis	116
4.4.2. IMS satellite integration: transparent approach	117
4.4.3. IMS satellite integration: integrated star approach	118
4.4.4. IMS satellite integration: integrated mesh approach	119
4.5. Toward a unified next-generation network (NGN) QoS architecture	120
4.5.1. Transparent integration scenario	120
4.5.2. Star integration scenario	125
4.5.3. Mesh integration scenario	127
4.6. SATSIX project	130
4.7. Conclusion	132
CHAPTER 5. INTER-SYSTEM MOBILITY	135
5.1. Introduction.	135
5.2. The taxonomy of mobility	136
5.2.1. Personal mobility	136
5.2.2. Session mobility	137
5.2.3. Mobility of service	137
5.2.4. Mobility of the terminal	137
5.2.5. Network mobility	139
5.2.6. Clarification for mobility terminology	139
5.3. Protocols for mobility management	139
5.3.1. Extension of DVB-RCS for mobility	140
5.3.2. Management by the network layer: mobile IP	141
5.3.3. Mobility management with session initiation protocols (SIPs).	156
5.4. Implementation of mobility solutions in hybrid systems	159
5.4.1. Specification of SIP mobility in a DVB-S2/RCS system	160
5.4.2. Theoretical evaluations and recommendations.	165
5.5. SIP for mobility management and QoS for interactive applications	177
5.6. Evaluation of mobility solutions in a simulated DVB-S2/RCS architecture	179

5.6.1. Comparison of interruption times	180
5.6.2. Common cases	180
5.6.3. Specific cases	183
5.6.4. Problems related to overheads	184
5.7. Conclusion	185
CHAPTER 6. THE TRANSPORT LAYER IN HYBRID NETWORKS	187
6.1. Introduction.	187
6.2. Performance enhancing proxies	189
6.2.1. Space communications protocol specifications	190
6.2.2. I-PEP	193
6.2.3. Issues related to PEPs	196
6.3. TCP evolutions.	198
6.3.1. TCP adaptations to the satellite environment	199
6.3.2. Options and mechanisms for TCP improvements	200
6.3.3. New TCP versions	202
6.3.4. Characteristics of the satellite connection	204
6.3.5. Impact on the transport layer	206
6.3.6. Conclusion.	207
6.4. TCP performance in a geostationary network.	208
6.4.1. Measurement and analysis methodology	208
6.4.2. The configuration of the system and measurements	208
6.5. TCP in a hybrid context	215
6.5.1. The impact of a hybrid network on the transport layer	215
6.5.2. Control of the adaptation of streams to the new network.	216
6.5.3. TCP impacts for a break before make handover.	217
6.5.4. TCP impacts for a make before break handover.	217
6.5.5. The effect on TCP of the vertical handover with simultaneous variation of the bandwidth and delay.	218
6.5.6. Conclusion.	220
6.6. General conclusion	221
CONCLUSION.	223
