Contents

Preface vii

Notations ix

Chapter 1. General Points 1

1.1. Introduction 1
1.2. Tools to analyze and develop control strategies 2
1.2.1. Numerical simulations 2
1.2.2. Sensors. 3
1.2.3. Actuators 20

Chapter 2. Summary of the Main Characteristics of Wall Turbulence 23

2.1. Introduction 23
2.2. General equations. 23
2.2.1. Eulerian relations 24
2.3. Notations 25
2.4. Reynolds equations. 26
2.5. Exact relations and FIK identity 27
2.6. Equations for a turbulent boundary layer 32
2.7. Scales in a turbulent wall flow 34
2.8. Turbulent viscosity closures 35
2.9. Turbulent intensities of the velocity components 47
2.10. Vorticity and near wall coherent structures 51

Chapter 3. Passive Control 65

3.1. Introduction 65
3.2. Large eddy (outer layer) breakup devices, LEBUs (OLDs) 66
3.2.1. General 66
3.2.2. Alteration of the inner structure by outer layer devices 67
3.3. Riblets 72
3.3.1. General 72
3.3.2. Effect of the riblets on the fine structure of wall turbulence. 76
3.3.3. Effect of the protrusion height 84
3.4. Superhydrophobic surfaces. 93

Chapter 4. Active Control 99

4.1. Introduction 99
4.2. Local blowing 100
4.3. Ad-hoc control 107
4.4. Transverse wall oscillations 115
4.5. Alternated spanwise Lorenz forcing and electromagnetic (EM) control. 123
4.6. Extensions of spanwise forcing 131
4.7. Reynolds number dependence 132
4.8. Suboptimal active control 134
4.9. Optimal active control 143
4.10. Optimal linear control 147
4.11. Neural networks 156
4.12. Stochastic synchronization of the wall turbulence and dual control 157

Bibliography 167
