 \end{array}$$

Figure 1.22. Jacobian matrix of the evolution function at point x_0

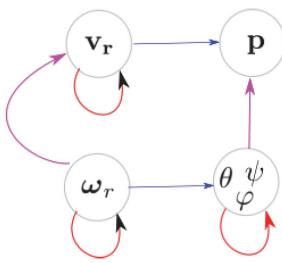

Figure 1.23. Graph of the differential delays for the floating wheel

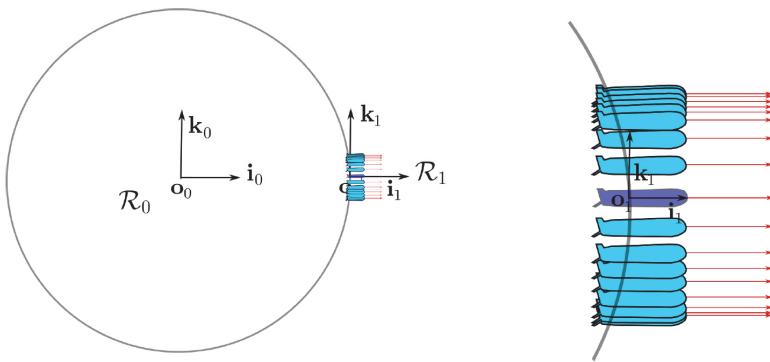

Figure 1.25. Fake periodic trajectory returned by the inertial unit which feels the same as if it were static as for R_1 . The corresponding measured acceleration $a_{\text{mes}} r$ is painted red. The right subpicture corresponds to a zoom around R_1

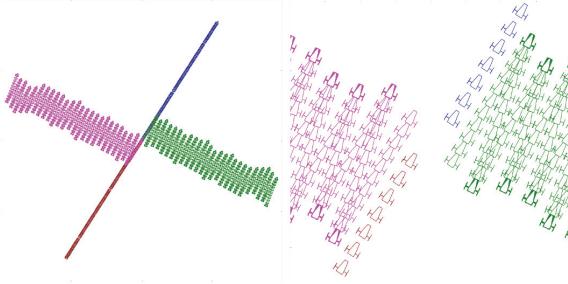

Figure 1.26. Left: simulation of the controller based on the Lie bracket technique. The frame box is $[-1, 1] \times [-1, 1]$. Right: the same picture, but with a frame box equal to $[-0.2, 0.2] \times [-0.2, 0.2]$. To avoid superposition in the picture, the size of the car has been reduced by 1/1000. The length of the forward/backward subpaths corresponds to 10cm approximately

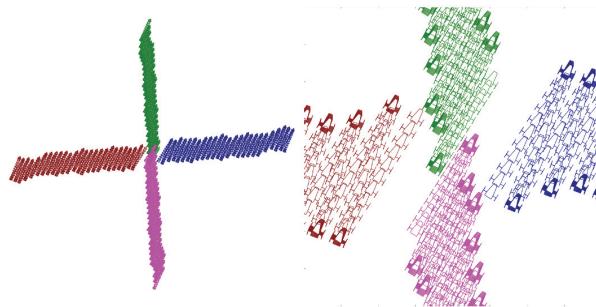

Figure 1.27. Left: The car goes from 0 toward all cardinal directions. The frame box is $[-1, 1] \times [-1, 1]$. Right: the same picture, but with a frame box equal to $[-0.2, 0.2] \times [-0.2, 0.2]$

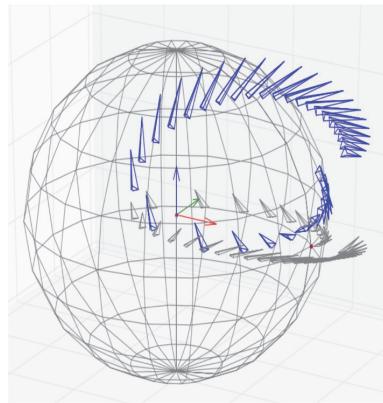

Figure 1.28. The robot moves like a satellite around the Earth

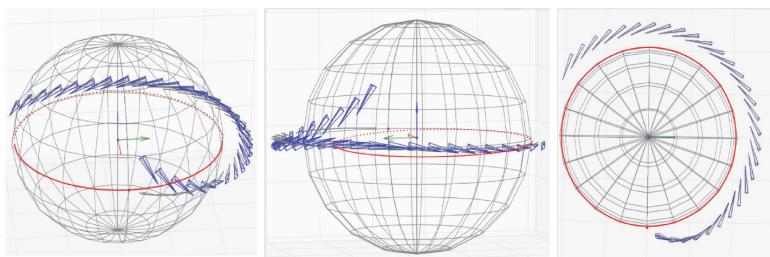

Figure 1.30. The robot follows the equator toward the east

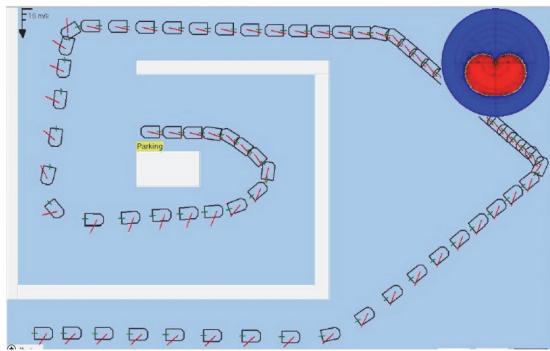

Figure 2.10. By using a linearizing controller, the robot docks in its place in the harbor; the polar curve is represented on the top right corner

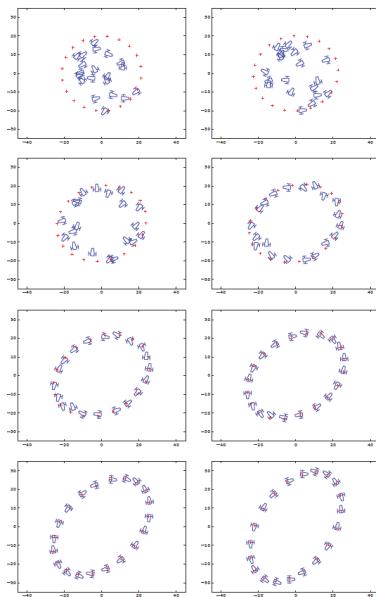

Figure 2.26. During the transient phase, all robots go toward their setpoints in the ellipse. Then, the group exactly follows the deformation of the ellipse

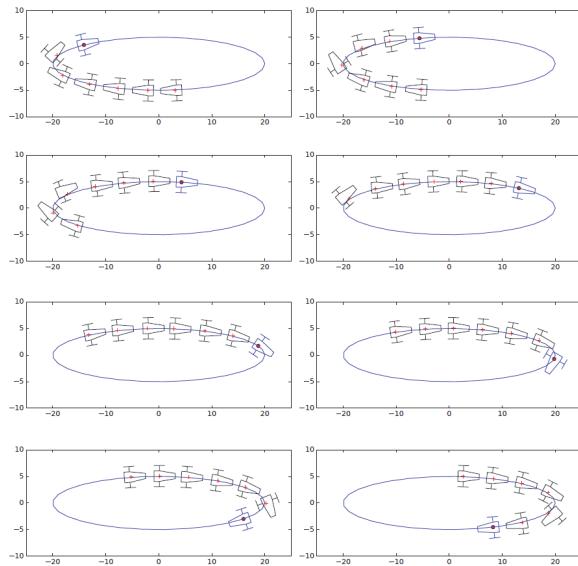

Figure 2.27. After the transient phase, all robots follow the leader with a constant separation distance between two robots

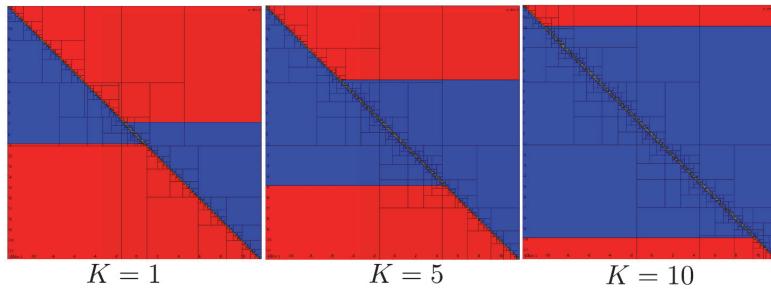

Figure 2.33. Sets S_k for $K = 1, 5, 10$ in red. When K is large, the probability to go toward the sliding surface increases

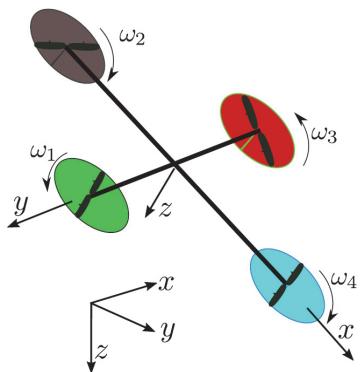

Figure 3.25. The quadrotor to be controlled

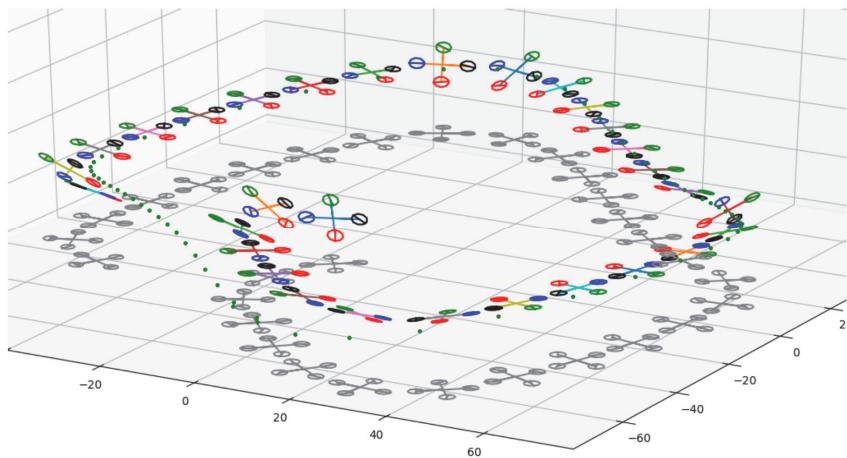

Figure 3.27. Simulation of the quadrotor which follows the Van der Pol cycle

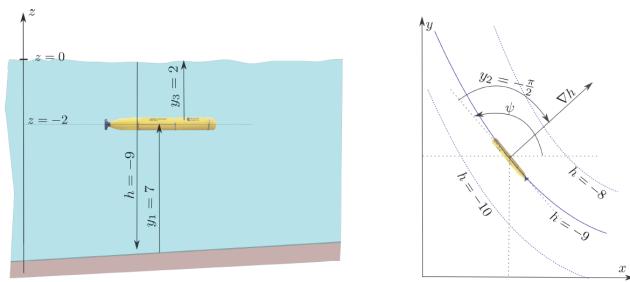

Figure 3.28. Underwater robot that has to follow an isobath

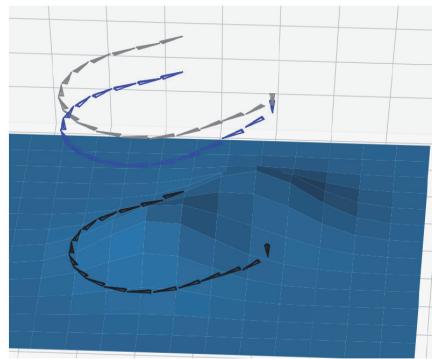

Figure 3.29. Simulation of an underwater robot (blue) following an isobath. The surface shadow (gray) and the seafloor shadow (black) are also depicted. (See exercise 3.8)

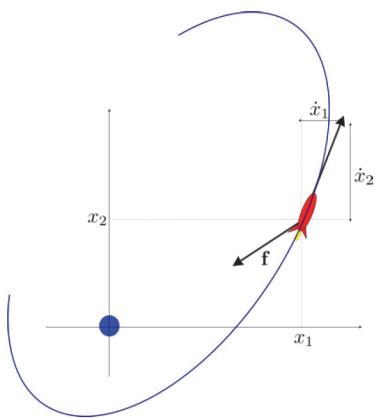

Figure 3.30. The planet (blue) at coordinates $(0, 0)$ and the satellite (red) at coordinates (x_1, x_2)

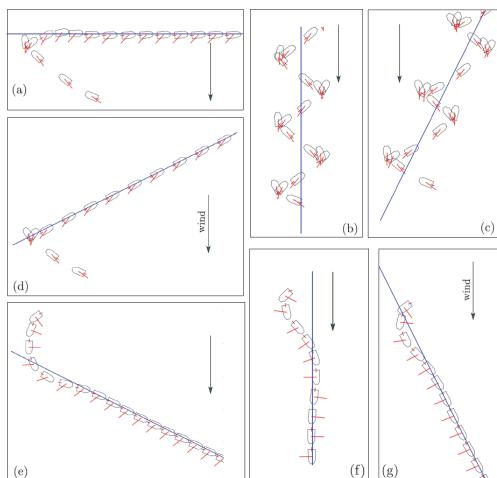

Figure 3.33. Simulation for the line following of a sailboat

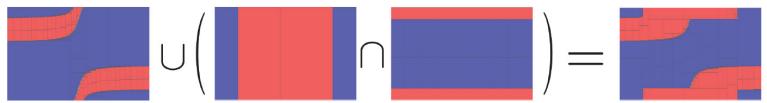

Figure 3.34.

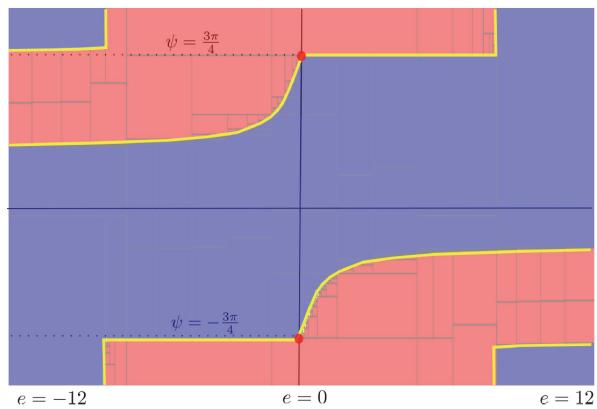

Figure 3.35.

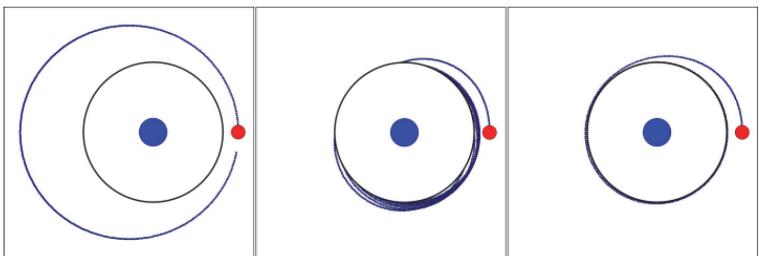

Figure 3.38.

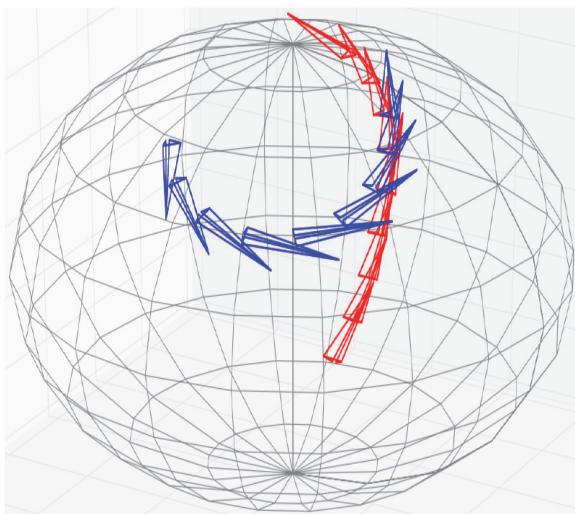

Figure 4.17. The blue robot R follows the red one R_a

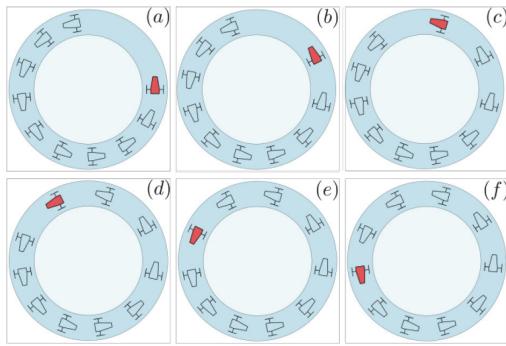

Figure 4.26. (a) initialization at time $t = 0$; (b)–(f) the controller yields a uniform distribution between cars

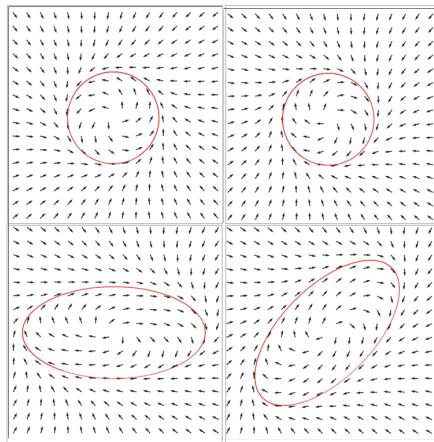

Figure 4.27. Generation of a vector field with a stable limit cycle corresponding to a specific ellipse

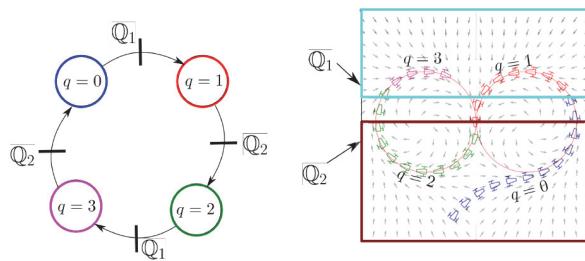

Figure 4.28. Automaton switching from one field to the other

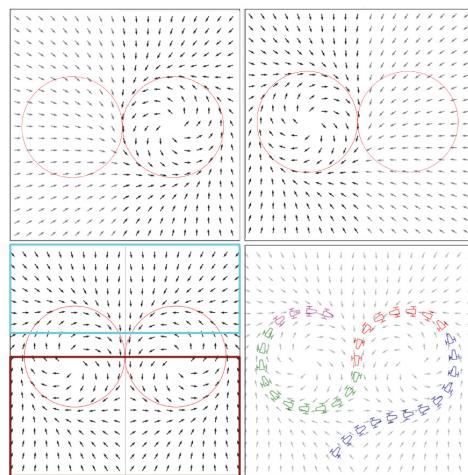

Figure 4.29. Top: the two vector fields; bottom left: A superposition of the two fields with the two transition sets Q_1, Q_2 ; Bottom right: the resulting trajectory forms an eight

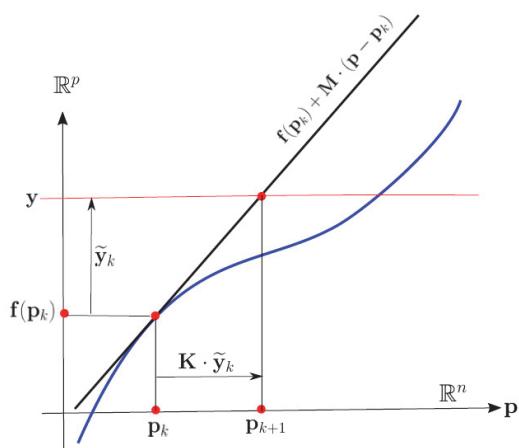

Figure 6.2. The Newton method to minimize $\|f(p) - y\|_2$
