Preface	xvii
Abhishek KUMAR, Priya BATTÀ, Sachin AHUJA and Pramod Singh RATHORE	
Introduction	xix
Abhishek KUMAR, Priya BATTÀ, Sachin AHUJA and Pramod Singh RATHORE	
Chapter 1. ML for Predictive Recovery Models in Physiotherapy	1
Suraj KANASE and G.M. VAIDYA	
1.1. Introduction	1
1.2. Overview of ML in healthcare	3
1.3. ML techniques for predictive recovery in physiotherapy.	4
1.3.1. Supervised learning.	5
1.3.2. Unsupervised learning	5
1.3.3. Deep learning	6
1.3.4. Reinforcement learning.	6
1.3.5. Hybrid and ensemble approaches	6
1.4. Applications of ML in physiotherapy	7
1.4.1. Post-stroke rehabilitation.	8
1.4.2. Musculoskeletal rehabilitation	8
1.4.3. Neurological disorders	9
1.4.4. Sports physiotherapy and performance recovery.	9
1.4.5. Predicting adherence to home-based therapy.	9
1.5. Integration of ML with digital health tools	10
1.5.1. Wearable sensors and Internet-of-Things (IoT) devices	10
1.5.2. Motion capture and computer vision for exercise monitoring.	10
1.5.3. Telerehabilitation and mobile health applications	11
1.5.4. Virtual reality and gamification in rehabilitation.	11
1.5.5. Synergy of digital health and predictive models	11

1.6. Challenges in implementing ML predictive models	12
1.6.1. Data heterogeneity and quality issues	12
1.6.2. Algorithmic bias and fairness	12
1.6.3. Privacy and security concerns	13
1.6.4. Lack of generalizability and clinical validation	13
1.6.5. Barriers to clinician adoption	14
1.7. Future directions	14
1.7.1. Personalized rehabilitation pathways	14
1.7.2. Hybrid AI–human decision-making	15
1.7.3. Federated learning and privacy-preserving models	15
1.7.4. Integration of multimodal and longitudinal data	15
1.8. Conclusion	16
1.9. References	16
Chapter 2. AI-Powered Gait Analysis for Post-Injury Rehabilitation	21
Pragati SALUNKHE and K. GAVHALE	
2.1. Introduction	21
2.2. Fundamentals of gait analysis	23
2.2.1. The gait cycle	23
2.2.2. Spatiotemporal parameters	24
2.2.3. Kinematic and kinetic analysis.	24
2.2.4. Clinical significance of gait analysis	24
2.3. Conventional methods and their limitations	25
2.3.1. Observational gait analysis.	25
2.3.2. Motion capture systems	25
2.3.3. Force plates and pressure walkways.	26
2.3.4. Instrumented treadmills	26
2.3.5. Wearable sensor-based conventional methods	26
2.4. AI techniques in gait analysis.	27
2.4.1. ML in gait analysis	28
2.4.2. DL in gait analysis	29
2.4.3. Feature engineering and data fusion.	29
2.4.4. Explainable AI (XAI) in gait analysis.	30
2.5. Wearable and vision-based systems	30
2.5.1. Wearable sensor-based systems	30
2.5.2. Vision-based systems.	31
2.5.3. Hybrid approaches	32
2.5.4. Clinical relevance in post-injury rehabilitation.	32
2.6. Applications in post-injury rehabilitation	32
2.6.1. Anterior cruciate ligament (ACL) reconstruction	33
2.6.2. Hip fractures and arthroplasty	33
2.6.3. Ankle injuries and sprains	33

2.6.4. Neurological injuries and gait rehabilitation	33
2.6.5. Telerehabilitation and remote monitoring	34
2.7. Clinical integration and telerehabilitation	34
2.7.1. Barriers to clinical integration	34
2.7.2. Opportunities for clinical adoption	35
2.7.3. Telerehabilitation as a new model of care	35
2.7.4. Personalization through AI.	36
2.8. Challenges and future directions	36
2.8.1. Data-related challenges.	36
2.8.2. Clinical validation and generalizability	36
2.8.3. Integration with clinical workflows	37
2.8.4. Ethical and legal concerns	37
2.9. Conclusion	37
2.10. References	38
Chapter 3. DL Applications in Automated Physiotherapy	
Progress Tracking.	41
Ankita DURGAWALE and Fazil SHEIKH	
3.1. Introduction	42
3.2. Foundations of DL in healthcare	43
3.2.1. Evolution of DL models	43
3.2.2. Clinical data modalities.	44
3.2.3. Key benefits of DL in healthcare	44
3.2.4. Relevance to physiotherapy progress tracking	45
3.3. Physiotherapy and the need for automated progress tracking	45
3.3.1. Limitations of traditional progress tracking	45
3.3.2. Increasing demand for objective and scalable solutions	46
3.3.3. Patient-centered care and motivation	46
3.3.4. Enabling early detection of complications	46
3.3.5. Integration into telerehabilitation	47
3.4. Computer vision approaches for physiotherapy monitoring	47
3.4.1. Pose estimation and kinematic analysis.	47
3.4.2. Video-based exercise recognition	48
3.4.3. Range-of-motion assessment using CV.	48
3.4.4. Markerless motion capture versus traditional systems.	48
3.4.5. Clinical applications of CV in physiotherapy	48
3.5. wearable sensor integration and DL models.	49
3.5.1. Types of wearable sensors in physiotherapy	49
3.5.2. DL models for wearable sensor data	49
3.5.3. Applications in automated progress tracking.	50
3.6. Multimodal data fusion for comprehensive progress tracking	50
3.6.1. Rationale for multimodal integration	51
3.6.2. DL strategies for multimodal fusion.	51

3.6.3. Applications of multimodal fusion in physiotherapy	52
3.7. Personalization and adaptive DL in physiotherapy	53
3.7.1. The need for personalization in rehabilitation	53
3.7.2. Adaptive DL models	53
3.7.3. Personalization through multimodal integration	54
3.8. Telerehabilitation and remote monitoring applications.	54
3.8.1. The role of DL in telerehabilitation	54
3.8.2. Remote monitoring in daily life	54
3.8.3. Accessibility and equity in rehabilitation	55
3.8.4. Integration with healthcare ecosystems	55
3.8.5. Patient engagement and motivation in remote settings	55
3.9. Challenges in clinical integration.	56
3.9.1. Data quality and standardization.	56
3.9.2. Interpretability and clinical trust.	56
3.9.3. Workflow integration and usability	56
3.9.4. Regulatory and ethical considerations.	57
3.10. Conclusion	57
3.11. References	58
Chapter 4. Real-Time AI Feedback Systems for Postural Correction in Physiotherapy	61
Smita PATIL and Rasika Ranjit CHAFLE	
4.1. Introduction	62
4.2. The role of posture in physiotherapy.	62
4.2.1. Importance of postural correction in rehabilitation	63
4.2.2. Challenges in traditional postural assessment	63
4.2.3. Patient engagement and awareness	63
4.2.4. Integration of posture in physiotherapy goals	63
4.2.5. Limitations of conventional approaches	64
4.3. Evolution of AI in physiotherapy.	64
4.3.1. Early use of technology in rehabilitation	64
4.3.2. Emergence of ML in rehabilitation	65
4.3.3. Computer vision for postural analysis.	65
4.3.4. Transition towards real-time feedback	65
4.3.5. Personalization and adaptive learning.	65
4.4. Real-time AI feedback systems: mechanisms and technologies	66
4.4.1. Core mechanisms of real-time AI feedback	66
4.4.2. Computer vision-based feedback systems	66
4.4.3. Wearable sensor-based systems	67
4.4.4. Multimodal feedback integration	67
4.4.5. Feedback modalities: visual, auditory and haptic	69
4.4.6. Clinical and home applications	69

4.5. Applications in postural correction	69
4.5.1. Musculoskeletal rehabilitation	69
4.5.2. Neurological rehabilitation	70
4.5.3. Sports physiotherapy and performance training	70
4.5.4. Pediatric and geriatric applications	71
4.5.5. Workplace and occupational health	71
4.6. Wearables, sensors and vision-based AI approaches	71
4.6.1. Wearable sensor-based approaches	71
4.6.2. Vision-based approaches	72
4.6.3. Hybrid models: integrating wearables and vision	72
4.6.4. Feedback modalities across devices	72
4.7. Benefits in clinical and home-based physiotherapy	72
4.7.1. Enhanced accuracy and objectivity	73
4.7.2. Improved patient engagement and motivation	73
4.7.3. Extending physiotherapy beyond the clinic	73
4.7.4. Reducing therapist workload and optimizing resources	73
4.7.5. Supporting telehealth and remote care models	74
4.7.6. Cost-effectiveness and accessibility	74
4.8. Challenges and limitations	74
4.8.1. Technical limitations	74
4.8.2. Clinical integration and usability	75
4.8.3. Data privacy and security	75
4.8.4. Patient adherence and acceptance	75
4.9. Future directions	76
4.9.1. Multimodal sensing and fusion	76
4.9.2. Personalization and adaptive learning	76
4.9.3. Integration with extended reality (XR)	76
4.9.4. Cloud-based and edge AI deployment	77
4.10. Conclusion	77
4.11. References	78
Chapter 5. Wearable Sensor Data and ML for Remote Physiotherapy Monitoring	81
Sandeep SHINDE and Shamla MANTRI	
5.1. Introduction	82
5.2. Wearable sensors for remote physiotherapy monitoring	83
5.2.1. Types of wearable sensors	83
5.2.2. Data acquisition and processing pipelines	85
5.2.3. Clinical applications of wearable sensors	86
5.2.4. Advantages and limitations of wearable sensors in physiotherapy	87
5.3. ML for sensor data interpretation in remote physiotherapy	87
5.3.1. Role of ML in remote physiotherapy	87
5.3.2. Types of ML approaches	88

5.3.3. Data preprocessing and feature engineering	89
5.3.4. Real-time data processing and feedback	89
5.3.5. Performance evaluation of ML models	90
5.3.6. Digital health ecosystem integration	90
5.4. Applications and case studies of wearable sensor data and ML in remote physiotherapy	90
5.4.1. Orthopedic rehabilitation	90
5.4.2. Neurological rehabilitation	91
5.4.3. Post-surgical rehabilitation and early discharge	91
5.4.4. Chronic pain and movement quality analysis	91
5.4.5. Pediatric and geriatric applications	92
5.4.6. Telerehabilitation platforms and scalable monitoring	92
5.4.7. Cross-condition generalizability	92
5.5. Challenges and future directions	93
5.5.1. Technical challenges	93
5.5.2. Clinical challenges	93
5.5.3. Data privacy, security and ethical issues	93
5.5.4. Future directions	94
5.6. Conclusion	96
5.7. References	96

**Chapter 6. AI-Driven Decision Support Systems for Personalized
Physiotherapy Plans** 101

Shraddha MOHITE and P. BAINALWAR

6.1. Introduction	101
6.2. Foundations of AI-DSS	103
6.2.1. Definition and components of DSS	103
6.2.2. Role of AI in enhancing decision-making	104
6.2.3. AI models used in physiotherapy DSS	104
6.2.4. Data sources for AI-DSS	104
6.2.5. From guidelines to data-driven decisions	106
6.3. Applications of AI-DSS in personalized physiotherapy	106
6.3.1. AI for diagnosis and assessment	107
6.3.2. Predicting recovery trajectories	107
6.3.3. Dynamic adaptation of physiotherapy plans	107
6.3.4. Role of wearable sensors and IoT integration	108
6.3.5. Virtual and augmented reality rehabilitation enhanced by AI	108
6.3.6. Case studies of AI-driven rehabilitation platforms	108
6.3.7. Broader impact on patient engagement	109
6.4. Clinical benefits and patient outcomes	109
6.4.1. Improved precision and personalization	109
6.4.2. Enhanced treatment adherence	110
6.4.3. Reduction of relapse and secondary complications	110

6.4.4. Cost-effectiveness and resource optimization	111
6.4.5. Empowering patients through self-management	111
6.5. Challenges and limitations	111
6.5.1. Data privacy, security and ethical concerns	111
6.5.2. Algorithm bias and fairness	112
6.5.3. Interpretability and transparency	112
6.5.4. Clinical workflow guesting in clinical workflows	112
6.5.5. Technical limitations in low-resource settings	113
6.5.6. Resistance by clinicians and patients	113
6.6. Future directions	113
6.6.1. Hybrid human–AI decision-making	113
6.6.2. Federated and privacy-preserving learning	114
6.6.3. Multimodal data integration for holistic rehabilitation	114
6.6.4. Explainable and trustworthy AI	114
6.6.5. Global scalability and equity	114
6.6.6. Interrelation with emerging technologies	115
6.6.7. Roadmap for the next decade	115
6.7. Conclusion	116
6.8. References	116
Chapter 7. Reinforcement Learning for Adaptive Exercise Prescription in Rehabilitation	121
Omkar SOMADE and Chandrayani ROKDE	
7.1. Introduction	122
7.2. RL foundations for rehabilitation.	124
7.2.1. State representation	124
7.2.2. Actions and policy learning	124
7.2.3. Reward function design	125
7.2.4. Exploration–exploitation trade-off	125
7.2.5. Time horizons and sequential adaptation	125
7.2.6. Clinical interpretability	126
7.3. Robotic rehabilitation applications	127
7.3.1. Robotic gait training	127
7.3.2. Upper limb robotic therapy	127
7.3.3. Multi-joint and whole-body coordination.	128
7.3.4. Enhancing patient engagement and motivation.	128
7.3.5. Safety considerations in robotic RL	128
7.3.6. Clinical translation and practical barriers	129
7.4. Beyond robotics: chronic disease and treatment regimes.	129
7.4.1. RL in chronic disease rehabilitation.	129
7.4.2. RL for cancer survivorship and long-term rehabilitation	129
7.4.3. RL in medication and lifestyle regimes	130
7.4.4. Federated and remote learning in chronic rehabilitation.	130

7.4.5. Overcoming adherence challenges	130
7.4.6. Clinical translation and limitations	131
7.5. Sensor integration and data-driven RL.	131
7.5.1. Wearable sensors for biomechanical and physiological monitoring	131
7.5.2. Multi-modal data integration.	132
7.5.3. Edge computing and on-device learning	132
7.5.4. Data quality and robustness in RL systems.	132
7.5.5. Cloud-based platforms and federated RL.	133
7.5.6. Closing the loop with feedback modalities	133
7.6. Neuromechanical adaptations, ethics, challenges and future directions.	134
7.6.1. Neuromechanical adaptations in RL-guided rehabilitation	134
7.6.2. Ethical considerations	134
7.6.3. Clinical challenges and translation barriers.	135
7.6.4. Future directions in RL for rehabilitation.	135
7.7. Conclusion	136
7.8. References	136

Chapter 8. Computer Vision and AI for Automated Joint Range-of-Motion Assessment 141

T. Poovishnu DEVI and Jiwan DEHANKAR

8.1. Introduction	141
8.1.1. Limitations of conventional approaches	142
8.1.2. Emergence of computer vision and AI	142
8.1.3. Clinical relevance.	143
8.1.4. Research and validation landscape	143
8.2. Traditional approaches to ROM assessment.	144
8.2.1. Manual goniometry.	144
8.2.2. Inclometers	144
8.2.3. IMUs	145
8.2.4. Optical motion capture systems	145
8.3. CV-based ROM assessment	147
8.3.1. Marker-based vision systems	147
8.3.2. Markerless pose estimation	147
8.3.3. Integration with AI	148
8.3.4. Advantages and current limitations	148
8.4. Clinical applications of CV and AI for ROM assessment	149
8.4.1. Orthopedics and post-surgical rehabilitation	149
8.4.2. Neurology and neurorehabilitation	149
8.4.3. Sports medicine and performance optimization	150
8.4.4. Geriatrics and fall risk assessment.	150
8.4.5. Telerehabilitation and home-based care.	151
8.4.6. Challenges in clinical integration	151

8.5. Challenges and ethical concerns in automated ROM assessment	151
8.5.1. Data quality and diversity	151
8.5.2. Model accuracy and reliability	152
8.5.3. Clinical workflow integration	152
8.5.4. Regulatory and standardization issues	153
8.5.5. Ethical concerns: privacy and consent	153
8.5.6. Algorithmic bias and equity	153
8.5.7. Cost and accessibility barriers	154
8.6. Future directions in AI and CV for ROM assessment	154
8.6.1. Multimodal AI for holistic movement analysis.	154
8.6.2. Advances in markerless 3D pose estimation	155
8.6.3. Personalized and predictive rehabilitation	155
8.6.4. Extended reality (augmented reality/virtual reality) in rehabilitation.	155
8.6.5. Robotics and intelligent exoskeletons	156
8.6.6. Secure and transparent data infrastructure	156
8.7. Conclusion	157
8.8. References	157
Chapter 9. ML Models for Early Detection of Movement Disorders in Physiotherapy.	161
S. ANANDH and Swapna KAMBLE	
9.1. Introduction	162
9.2. Overview of movement disorders in physiotherapy	163
9.2.1. Parkinsonian disorders	163
9.2.2. Ataxias	164
9.2.3. Dystonia and other hyperkinetic disorders	164
9.2.4. Stroke-related movement disorders	165
9.2.5. Functional movement disorders (FMDs)	165
9.2.6. Role of physiotherapy in early detection	165
9.2.7. The case for early intervention.	166
9.3. ML approaches in movement disorder detection	166
9.3.1. Supervised learning	166
9.3.2. Unsupervised learning	167
9.3.3. Deep learning	167
9.3.4. Hybrid and ensemble approaches	168
9.3.5. Future directions	168
9.4. Data sources and feature extraction in physiotherapy	168
9.4.1. Wearable sensors	170
9.4.2. Motion capture systems	170
9.4.3. Electromyography (EMG)	170
9.4.4. Video and computer vision data	171
9.4.5. Multimodal data integration	171
9.4.6. Challenges and opportunities	171

9.5. Clinical applications in physiotherapy	172
9.5.1. Early diagnosis of neurological movement disorders	172
9.5.2. Monitoring disease progression	173
9.5.3. Personalization of rehabilitation programs	173
9.5.4. Telerehabilitation and remote monitoring	174
9.5.5. Predicting functional outcomes	174
9.5.6. Limitations and barriers to clinical adoption	174
9.6. Challenges, limitations and ethical considerations	175
9.6.1. Data quality and standardization.	175
9.6.2. Model interpretability and clinical trust.	175
9.6.3. Ethical and privacy concerns.	176
9.6.4. Regulatory and implementation barriers	176
9.6.5. Balancing automation with human expertise	176
9.6.6. Future directions	177
9.7. Conclusion	177
9.8. References	178

Chapter 10. AI-Based Predictive Analytics for Sports Injury Prevention and Recovery

181

Vaishali JAGTAP and Kalpana MALPE

10.1. Introduction.	182
10.2. Data sources for predictive analytics in sports.	183
10.2.1. Wearable sensors	184
10.2.2. Video-based motion capture and computer vision	185
10.2.3. Clinical and electronic health records	185
10.2.4. Multimodal data integration	185
10.2.5. Data quality and challenges.	186
10.3. AI techniques in sports injury prediction.	186
10.3.1. ML models.	186
10.3.2. DL approaches.	187
10.3.3. Hybrid and ensemble models.	187
10.3.4. Explainable AI for clinical trust	187
10.3.5. Limitations and challenges	188
10.4. Applications in injury prevention	188
10.4.1. Early risk detection	188
10.4.2. Workload monitoring and optimization	189
10.4.3. Personalized training adjustments	189
10.4.4. Predicting high-risk movements and patterns.	189
10.4.5. Prevention program inclusion	190
10.4.6. Challenges in implementation	190
10.5. Applications in injury recovery and rehabilitation	190
10.5.1. Predictive modeling for recovery timelines	190
10.5.2. AI-guided physiotherapy and exercise prescription	191

10.5.3. Return-to-play decision support	191
10.5.4. Long-term athlete monitoring	192
10.5.5. Benefits and challenges	192
10.6. Ethical, practical and implementation challenges	192
10.6.1. Data privacy and security	193
10.6.2. Algorithmic bias and fairness.	193
10.6.3. Integration into clinical and coaching processes	193
10.6.4. Resource disparities and accessibility	194
10.6.5. Ethical concerns around decision-making.	194
10.6.6. Cultural and psychological barriers	194
10.6.7. Moving toward responsible implementation	195
10.7. Future directions	195
10.7.1. Digital twins for athlete simulation	195
10.7.2. Federated learning and collaborative models	195
10.7.3. Integration with virtual and augmented reality rehabilitation	196
10.7.4. Personalized precision sports medicine	196
10.8. Conclusion	197
10.9. References	197
List of Authors	201
