Foreword ix

Acknowledgments xiii

Introduction xv

Chapter 1. Useful Concepts and Representation Formalisms 1

1.1. Useful concepts 1
1.1.1. Information 1
1.1.2. Information processing 2
1.1.3. Problem 2
1.1.4. Comprehension 4
1.1.5. Memory 6
1.2. Some formalisms used in cognitive psychology to represent knowledge stored in the LTM 10
1.2.1. Semantic networks: a representation formalism for declarative knowledge 11
1.2.2. A representation formalism for procedural knowledge 13
1.2.3. A representation formalism for the comprehension process. 16

Chapter 2. Definition and Historical Overview 23

2.1. Definition 23
2.2. Conceptual frameworks 26
2.3. Principal concepts of problem-solving 28
2.3.1. The “problem space” and “path” concepts 29
2.3.2. The “heuristic” and “search tree” concepts 32
2.4. Formal models 35
2.4.1. Models based on rules of production 36

Chapter 3. Learning to Solve a Problem 43

3.1. Breaking down a complex problem into sub-problems 44
3.1.1. Lee, J. and Anderson, J.R. (2001) 44
3.2. The four stages of problem-solving 52
3.2.1. Anderson, Pyke and Fincham (2016) 52
3.3. The three stages of learning by problem-solving 56
3.3.1. Tenison, Fincham and Anderson (2016) 56

Chapter 4. Learning a Concept from Examples of Concepts: Induction 63

4.1. Rule-based category learning 67
4.2. The question of "confirmation bias" 72
4.3. The duality between rule-based concept identification and similarity-based concept identification 75
4.4. Concluding remarks 85

Chapter 5. Implicit Learning 89

5.1. Presentation 89
5.2. What have learners learned, and are they aware of the knowledge which they acquire? 92
5.2.1. The princeps research work 92
5.2.2. What knowledge does the subject need to acquire? 99
5.3. Fragment status and the question of "abstract" or "concrete" acquired knowledge 102
5.3.1. The status of fragments in artificial grammar learning experiments 102
5.3.2. The nature of acquired knowledge: abstract or concrete? 104
5.4. Conclusion on implicit learning 107
5.4.1. Implicit learning and statistical learning 107
5.4.2. Individual differences 109
5.4.3. Statistical learning mechanisms 110
5.4.4. Applications of statistical learning 111

Chapter 6. The Role of Prior Knowledge in Constructing a Representation of a Problem 113

6.1. Experimental method based on comparing group results 114
6.2. Experimental method based on multiple trials of the same problem with vocal description of actions by the subject: individual protocol and modeling 123

6.3. Experimental method using learning transfer to study the effect of problem presentation in the choice of prior knowledge . . . 126
6.3.1. General hypotheses . . . 127
6.3.2. Material used . . . 128
6.3.3. Experimental hypotheses . . . 131
6.3.4. The experiments . . . 132
6.3.5. Conclusion . . . 139
6.4. Conclusion: the role of prior knowledge in the construction of problem representations . . . 139

Chapter 7. Acquiring Knowledge in a Specific Domain . . . 143

7.1. Learning through (self-)explanation . . . 143
7.1.1. Learning to solve problems by studying examples of solutions . . . 144
7.1.2. Acquisition of declarative knowledge concerning the human circulatory system . . . 147
7.1.3. Knowledge acquisition in physics . . . 154
7.1.4. Brief conclusion . . . 160
7.2. Problem-based learning . . . 161
7.2.1. Results . . . 164
7.3. Appendix: some notes on cognitive load theory . . . 165

Chapter 8. Causal Learning . . . 169

8.1. Historical overview . . . 170
8.2. Conceptual framework . . . 172
8.2.1. Temporal and spatial contiguity . . . 172
8.2.2. Temporal priority: cause before effect . . . 173
8.2.3. Contingency . . . 174
8.2.4. Prior experience . . . 175
8.3. Formalization and experimental research on adults . . . 176
8.3.1. Probabilistic models of causal learning . . . 177
8.3.2. Two examples of research on adults . . . 180
8.3.3. Causal learning in adults: conclusion . . . 193
8.4. Experimental research on children . . . 194
8.4.1. The above/below relation . . . 196
8.4.2. The “same/different” relation . . . 198
8.4.3. Knowledge of the domain in which a problem situation is represented . . . 200
8.4.4. Self-directed learning in children . . . 203
8.4.5. Conclusion: causal learning in children . . . 204

Chapter 9. Symbolic Processing System Models in Cognitive Psychology 213

9.1. Why formalize? 213
9.2. Modeling complex skill acquisition using ACT-R 214
9.3. Modeling a two-player game 219
9.4. A model of learning through multiple analogies 229
9.4.1. Knowledge acquisition: first type 230
9.4.2. Knowledge acquisition: second type 232
9.5. Robert Siegler's two models for learning arithmetic calculation 239
9.6. Links between SPS models in cognitive psychology and learning models in AI 247

Conclusion 251
