Preface	xi
Serge BOUFFARD and Nathalie MONCOFFRE	
Chapter 1. Irradiation Defects	1
Serge BOUFFARD and David SIMÉONE	
1.1. Introduction	1
1.2. Some basic data	2
1.2.1. Radiative environments and nuclear materials	2
1.2.2. Some notions about the transport of particles in matter	5
1.2.3. The zoology of irradiation defects.	9
1.3. Defect creation mechanisms	11
1.3.1. Creation of defects by elastic collisions.	13
1.3.2. Amorphization	16
1.3.3. Creation of defects by electronic excitation	18
1.3.4. Synergy between elastic collisions and electronic excitations	26
1.4. Kinetics of defect evolution.	28
1.4.1. Mean field approach: reaction rate theory	29
1.4.2. Evolution of extended defects: kinetics of clusters in the mean field.	33
1.4.3. Kinetic Monte Carlo approach.	34
1.4.4. Phase field approach	36
1.5. Open-ended problems	38
1.6. Acknowledgements	40
1.7. References	40
Chapter 2. Metal Alloys.	47
Philippe PAREIGE and Christophe DOMAIN	
2.1. Introduction	47
2.2. Fuel cladding.	52
2.2.1. Growth and creep under irradiation	54
2.2.2. Stress corrosion cracking.	56

2.2.3. The mechanisms of the evolution of the properties under irradiation . . .	57
2.2.4. Simulations of growth and creep under irradiation.	58
2.3. Internal structures in austenitic steel	59
2.3.1. An effect of irradiation: intergranular segregation	61
2.3.2. Evolution of mechanical properties under irradiation	64
2.3.3. Creep under irradiation	65
2.3.4. Swelling	66
2.3.5. Irradiation-assisted stress corrosion cracking.	67
2.4. The vessel	69
2.4.1. Changes in tenacity and resilience.	70
2.4.2. Cluster dynamics	72
2.5. Perspectives	77
2.6. References	80
Chapter 3. Ceramics within PWRs	87
Christine DELAFOY, Frederico GARRIDO and Yves PIPON	
3.1. Introduction	87
3.2. Development and typical properties of UO_2 and B_4C ceramics	91
3.2.1. Development and structure of uranium dioxide	91
3.2.2. Development and structure of boron carbide	93
3.2.3. Thermomechanical characteristics of B_4C and UO_2	96
3.3. Aging of ceramics under irradiation	100
3.3.1. Evolution of the properties of uranium dioxide under irradiation.	101
3.3.2. Evolution of boron carbide properties under irradiation.	112
3.4. Future challenges	116
3.5. References	120
Chapter 4. Nuclear Graphite	125
Nicolas BÉRERD and Laurent PETIT	
4.1. What is nuclear graphite?	125
4.2. Why use graphite in nuclear reactors?	128
4.3. Evolution of nuclear graphite in reactors	129
4.3.1. Neutron irradiation	130
4.3.2. Irradiation defects in nuclear graphite.	133
4.3.3. Evolution of lattice parameters and crystallite size in irradiated graphite	139
4.3.4. Density and porosity evolution by radiolytic corrosion of graphite	141
4.3.5. What are the consequences at the macroscopic scale?	142
4.4. Conclusion	143
4.5. Acknowledgements	144
4.6. References	145

Chapter 5. Nuclear Glasses	151
Magaly TRIBET	
5.1. Glass of nuclear interest: their role and their aging conditions under irradiation	151
5.1.1. What is this kind of glass for?	151
5.1.2. What does this glass actually contain and in what form?	152
5.1.3. Nuclear glass radioactivity	154
5.1.4. A complex scenario of glass aging under deep geological conditions	157
5.2. How are the effects of long-term irradiation studied at the laboratory scale?	158
5.3. Closed system: evolution of glass subjected to its self-irradiation and to the accumulation of helium	161
5.3.1. Impact of $\beta\gamma$ irradiation.	161
5.3.2. Effects of α decays	163
5.3.3. Accumulation of helium	165
5.3.4. Summary of knowledge in closed system.	166
5.4. Open system: alteration of glass by water under irradiation	167
5.4.1. General information on the behavior of glass under water – methodology	167
5.4.2. Taking irradiation into account in this multi-phase system	170
5.4.3. Irradiation and initial alteration rate.	170
5.4.4. Irradiation and residual alteration rate.	172
5.4.5. Summary on the behavior of glass under water and under irradiation	174
5.5. Summary and prospects	175
5.6. Acknowledgements	176
5.7. References	176
Chapter 6. Radiolysis of Porous Materials and Radiolysis at Interfaces	181
Sophie LE CAËR and Jean-Philippe RENAULT	
6.1. Introduction	181
6.2. General information on radiolysis	182
6.2.1. A few definitions	182
6.2.2. Radiolysis of liquid water	183
6.3. Main porous materials of interest.	185
6.4. Dosimetry in heterogeneous media.	186
6.5. Production of dihydrogen by radiolysis of water in a confined medium	187
6.5.1. Methods for calculating the yield of dihydrogen production	187
6.5.2. Reaction mechanisms.	189
6.5.3. Different parameters influencing the production of dihydrogen under irradiation.	190
6.6. Understanding transient phenomena	191
6.6.1. Study of a short-lived species, the hydroxyl radical	191

6.6.2. Confinement effect on the reactions taking place and their rate constants	193
6.7. Conclusion: what about the effects of radiolytic species on materials?	196
6.8. References	197
Chapter 7. Concrete and Cement Materials under Irradiation	201
Pascal BOUNIOL	
7.1. Introduction	201
7.2. Radiation shielding concrete	202
7.2.1. Overview	202
7.2.2. Effects of irradiation on the cement matrix	203
7.2.3. Effects of irradiation on aggregates	204
7.2.4. Prediction of concrete damage	206
7.3. Waste conditioning matrices	207
7.3.1. Overview	207
7.3.2. Radiolysis of the cement matrix	207
7.3.3. Phenomenological couplings	210
7.4. Conclusion	211
7.5. References	212
Chapter 8. Organic Materials	215
Emmanuel BALANZAT and Muriel FERRY	
8.1. Introduction	215
8.2. Technological context	217
8.2.1. Organic materials of the nuclear industry	217
8.2.2. Polymers in the reactor building	220
8.2.3. Nuclear waste	222
8.3. Radiation exposure	224
8.3.1. The LET effect	224
8.3.2. β/γ irradiation	225
8.3.3. α irradiation	225
8.3.4. Thermal neutrons	227
8.3.5. Other projectiles	227
8.4. Irradiated polymers: phenomenology	228
8.4.1. Resistance of polymers to irradiation	228
8.4.2. Changes induced by irradiation	230
8.5. Radiolysis in anoxic polymers: fundamental effects	231
8.5.1. Polymer radiolysis: introduction	231
8.5.2. A textbook case: polyethylene	233
8.6. The radio-oxidation of polymers	236
8.6.1. Mechanism of radio-oxidation	236

8.6.2. Chemical and physical influences of the dose rate	239
8.6.3. α irradiation	241
8.7. Conclusion and perspectives	243
8.8. References	243
Chapter 9. Irradiation Tools	251
Serge BOUFFARD and Nathalie MONCOFFRE	
9.1. Why experiment with accelerators?	251
9.2. Irradiation conditions in nuclear energy	252
9.2.1. Characteristics of these particles.	252
9.2.2. How is irradiation simulated in a nuclear environment?.	253
9.3. Tools for simulation	256
9.3.1. Research reactors	256
9.3.2. Accelerators	258
9.3.3. Use of radioactive elements	264
9.4. Some major irradiation research centers	264
9.5. Conclusion	267
9.6. References	267
Chapter 10. Characterization of Irradiation Damage	269
Aurélie GENTILS, Stéphanie JUBLLOT-LECLERC and Patrick SIMON	
10.1. Introduction	269
10.2. Characterization of point defects	270
10.2.1. Positron annihilation spectroscopy.	270
10.2.2. Raman scattering	271
10.2.3. Other techniques.	274
10.3. Characterization of the global disorder and elastic strain	275
10.3.1. Raman spectroscopy	275
10.3.2. Ion beam analysis	277
10.3.3. X-ray diffraction.	280
10.4. Imaging of extended defects and cavities	282
10.5. Elemental analysis	284
10.6. In situ microstructural characterization of materials subjected to irradiation	286
10.7. Conclusion and perspectives	288
10.8. References	289
List of Authors	293
Index	295
