<b>Preface</b> . . . . .	xi
<b>Part 1. Programming</b> . . . . .	1
<b>Chapter 1. Linear Programming</b> . . . . .	3
1.1. Introduction . . . . .	3
1.2. Definitions . . . . .	3
1.3. Geometry of the linear program . . . . .	5
1.3.1. Polyhedra . . . . .	5
1.3.2. Extreme points and vertices . . . . .	6
1.4. Graphical solving of a linear program . . . . .	6
1.5. Simplex algorithm . . . . .	9
1.5.1. Basic solutions and basic feasible solutions . . . . .	9
1.5.2. Simplex tableau . . . . .	10
1.5.3. Change of feasible basis . . . . .	11
1.5.4. Existence and uniqueness of an optimal solution . . . . .	14
1.6. Initialization of the simplex algorithm . . . . .	15
1.6.1. Big $M$ method . . . . .	15
1.6.2. Auxiliary program or Phase I . . . . .	17
1.6.3. Degeneracy and cycling . . . . .	20
1.6.4. Geometric structure of realizable solutions . . . . .	21
1.7. Interior-point algorithm . . . . .	22
1.8. Duality . . . . .	23
1.8.1. Duality theorem . . . . .	25
1.9. Relaxation . . . . .	27
1.9.1. Lagrangian relaxation . . . . .	27
1.10. Postoptimal analysis . . . . .	29
1.10.1. Effect of modifying $b$ . . . . .	31
1.10.2. Effect of modifying $c$ . . . . .	32

1.11. Application to an inventory problem . . . . .	34
1.11.1. Optimal solution . . . . .	34
1.11.2. Sensitivity to variation in stock . . . . .	35
1.11.3. Dual problem of the competitor . . . . .	36
1.12. Using Matlab . . . . .	36
<b>Chapter 2. Integer Programming . . . . .</b>	<b>41</b>
2.1. Introduction . . . . .	41
2.2. Solving methods . . . . .	41
2.2.1. Branch-and-bound method . . . . .	42
2.2.2. The branch-and-cut method . . . . .	44
2.3. Binary programming . . . . .	49
2.3.1. Knapsack problem . . . . .	49
2.3.2. Investment problem . . . . .	50
2.4. Decomposition principle . . . . .	57
2.4.1. Benders decomposition . . . . .	58
2.5. Using Matlab . . . . .	62
<b>Chapter 3. Dynamic Programming . . . . .</b>	<b>65</b>
3.1. Introduction . . . . .	65
3.2. Solving strategy . . . . .	66
3.3. Discrete DP . . . . .	68
3.3.1. Bellman's equation and the principle of optimality . . . . .	68
3.3.2. Approach of the method . . . . .	70
3.3.3. A few examples of DP . . . . .	70
3.3.4. Solving an LP . . . . .	73
3.3.5. Shortest path problem . . . . .	74
3.3.6. Knapsack problem . . . . .	79
3.3.7. Stock management problem . . . . .	81
3.4. Continuous DP . . . . .	83
3.4.1. Hamilton–Jacobi equation . . . . .	84
3.4.2. Application to a consumption-savings model . . . . .	84
3.5. Stochastic DP . . . . .	85
3.5.1. Decision-chance process . . . . .	85
3.5.2. Solving method . . . . .	86
3.5.3. Application to a contract problem . . . . .	86
3.5.4. Optimal binary search tree . . . . .	87
3.6. Using Matlab . . . . .	91
<b>Chapter 4. Stochastic Programming . . . . .</b>	<b>93</b>
4.1. Introduction . . . . .	93
4.2. Presentation of the problem . . . . .	94

---

4.3. Optimal feedback in an open loop . . . . .	94
4.4. Stochastic linear programming . . . . .	95
4.4.1. Models with probability thresholds on the constraints . . . . .	96
4.5. Stochastic linear programs with recourse . . . . .	96
4.5.1. L-shaped method . . . . .	97
4.5.2. Multicut L-shaped method . . . . .	99
4.5.3. Interior linearization method . . . . .	100
4.6. Nonlinear stochastic programming . . . . .	100
4.6.1. Approaches to two-step problems with recourse . . . . .	100
4.6.2. Regularized decomposition method . . . . .	101
4.6.3. Methods based on the Lagrangian . . . . .	101
4.6.4. Frank–Wolfe method for problems with simple recourse . . . . .	103
4.6.5. Approximation by sampling average: Monte Carlo method . . . . .	105
4.6.6. Stochastic gradient method . . . . .	106
4.7. Stochastic dynamic programming . . . . .	107
4.7.1. Markov decision process . . . . .	108
4.7.2. Scenario tree . . . . .	109
4.8. Application to the reliability of mechanical systems . . . . .	111
4.8.1. Position and modeling of the reliability problem . . . . .	113
4.9. Using Matlab . . . . .	121
<b>Part 2. Optimization . . . . .</b>	<b>127</b>
<b>Chapter 5. Combinatorial Optimization . . . . .</b>	<b>129</b>
5.1. Introduction . . . . .	129
5.2. Symmetric TSP . . . . .	131
5.2.1. Historical overview . . . . .	132
5.2.2. Solving methods . . . . .	134
5.3. Asymmetric traveling salesman problem . . . . .	140
5.3.1. Variants of the ATSP . . . . .	140
5.3.2. Mathematical formulations . . . . .	142
5.3.3. Methods for solving the ATSP . . . . .	144
5.4. Vehicle routing problem . . . . .	148
5.4.1. Definition . . . . .	148
5.4.2. Fields of application . . . . .	149
5.4.3. Parameters of the VRP . . . . .	150
5.4.4. Variants of the VRP . . . . .	151
5.4.5. Mathematical formulation of the VRP . . . . .	153
5.4.6. Algorithmic complexity . . . . .	155
5.5. Selective routing problem . . . . .	156
5.5.1. Problems similar to the VRP . . . . .	157
5.5.2. Mathematical formulation . . . . .	157
5.6. Using Matlab . . . . .	158

---

<b>Chapter 6. Unconstrained Nonlinear Programming</b> . . . . .	161
6.1. Introduction . . . . .	161
6.2. Mathematical formulation . . . . .	161
6.2.1. Existence and uniqueness results . . . . .	162
6.3. Optimality conditions . . . . .	162
6.4. Quadratic problems . . . . .	163
6.4.1. Gradient method with optimal step size . . . . .	163
6.4.2. Conjugate gradient method . . . . .	164
6.5. Newton's algorithm . . . . .	164
6.6. Methods of descent and linear search . . . . .	165
6.6.1. Presentation of methods of descent . . . . .	165
6.6.2. Method of greatest slope . . . . .	167
6.6.3. Acceptable step size . . . . .	168
6.6.4. Linear search . . . . .	169
6.6.5. Newton's method with linear search . . . . .	170
6.7. Quasi-Newton methods . . . . .	171
6.7.1. DFP and BFGS methods . . . . .	172
6.8. Relaxation method . . . . .	173
6.9. Gradient method . . . . .	175
6.10. Least squares problem . . . . .	176
6.10.1. Gauss–Newton method . . . . .	176
6.10.2. Levenberg–Marquardt algorithm . . . . .	178
6.10.3. Kalman filter . . . . .	179
6.11. Direct search methods . . . . .	181
6.11.1. Nelder–Mead algorithm . . . . .	181
6.11.2. Torczon method . . . . .	183
6.12. Application to an identification problem . . . . .	183
6.13. Using Matlab . . . . .	185
6.13.1. The <i>fminsearch</i> function . . . . .	187
6.13.2. The <i>fminunc</i> function . . . . .	188
6.13.3. Relaxation method . . . . .	190
<b>Chapter 7. Constrained Nonlinear Optimization</b> . . . . .	193
7.1. Introduction . . . . .	193
7.2. Mathematical formulation . . . . .	193
7.3. Lagrange multipliers . . . . .	194
7.4. Optimization with inequality constraints . . . . .	195
7.4.1. First-order conditions of optimality . . . . .	195
7.4.2. Presentation of saddle points . . . . .	197
7.4.3. Saddle point and optimization . . . . .	198
7.4.4. Convex case . . . . .	201
7.5. Constrained minimization algorithms . . . . .	201
7.5.1. Relaxation method . . . . .	202

---

7.5.2. Projection method . . . . .	202
7.5.3. Exterior penalty method . . . . .	204
7.5.4. Uzawa's algorithm . . . . .	205
7.6. Newton algorithms: SQP method . . . . .	206
7.6.1. Equality constraints . . . . .	207
7.6.2. Inequality constraints . . . . .	209
7.7. Application to structure optimization . . . . .	210
7.8. Using Matlab . . . . .	217
7.8.1. The <i>fmincon</i> function . . . . .	219
7.8.2. The <i>fminbnd</i> function . . . . .	220
7.8.3. Penalty method . . . . .	221
<b>Appendices . . . . .</b>	<b>229</b>
<b>Appendix 1. Reminders from Linear Algebra . . . . .</b>	<b>231</b>
<b>Appendix 2. Reminders about functions from <math>\mathbb{R}^n</math> into <math>\mathbb{R}</math> . . . . .</b>	<b>241</b>
<b>Appendix 3. Optimization Toolbox . . . . .</b>	<b>245</b>
<b>Appendix 4. Software . . . . .</b>	<b>249</b>
<b>References . . . . .</b>	<b>253</b>
<b>Index . . . . .</b>	<b>261</b>
