Preface	ix
Chapter 1. General Information on Antennas	1
Jean-Pierre BLOT	
1.1. Definition, context, and regulation	1
1.1.1. The International Union of Telecommunications and Radiocommunications (ITU-R)	9
1.1.2. Frequency bands: uses and classification (see also appendices 3 and 5)	10
1.1.3. Review of some technologies by frequency bands (see also appendices 3 and 5)	12
1.2. Propagation and radiation	19
1.3. Antenna and sensor	20
1.3.1. Antenna operating in transmission and reception	23
1.4. Theorems and important principles of electromagnetism	27
1.4.1. Lorentz reciprocity theorem	27
1.4.2. Huygens-Fresnel principle	28
1.4.3. Uniqueness theorem	30
1.4.4. Image theory	30
1.4.5. Superposition principle	30

Chapter 2. Fundamental Equations Used in Antenna Design	31
Jean-Pierre BLOT	
2.1. Formulations of Maxwell's equations to calculate the radiation of electromagnetic sources	31
2.1.1. Maxwell's equations	32
2.1.2. Material media.	34
2.1.3. Vectors \vec{D} and \vec{H}	36
2.1.4. Source currents and induced currents	42
2.1.5. Integral form of Maxwell's equation	44
2.2. Boundary conditions between two media	44
2.3. Vector potential	47
2.3.1. Propagation equations for the vector potential	50
2.3.2. Propagation equations for the scalar potential	52
2.3.3. Vector and scalar potentials in the harmonic regime	53
2.4. Propagation equation for fields \vec{E} and \vec{H}	54
2.5. Solving the Helmholtz equations for the vector and scalar potentials	55
2.5.1. Orthogonality of distance fields zone and radiated power; radiation pattern	57
2.6. Harmonic form of Maxwell's equations	61
2.7. Physical interpretation of the Poynting theorem	61
2.7.1. Poynting vector in the time domain	61
2.7.2. Poynting vector in the frequency domain	64
2.8. Polarized wave	65
2.8.1. Definition of a plane wave.	65
2.8.2. Polarizations of a wave.	66
2.9. Calculating the electromagnetic field radiated by an antenna	72
2.9.1. Expanded discussion of the EFIE and MFIE formulae	72
2.9.2. Calculations for an elementary dipole	73
2.10. Aperture antenna	76
2.10.1. Wireless radiation of apertures	76
2.10.2. Identification of the different zones	80
 Chapter 3. Different Antenna Technologies	 85
Jean-Pierre BLOT	
3.1. Horns	85
3.2. Coaxial cables and input guides in antennas	87
3.2.1. Coaxial cables	89
3.2.2. Waveguides	91

3.3. Supply to antennas, reference access, impedance matching and balun	105
3.3.1. Supply lines	105
3.3.2. Reference access	105
3.3.3. Matching networks	107
3.3.4. Baluns and symmetrizers	109
3.4. Reflector antennas	110
3.5. Printed antennas	115
3.5.1. Low-bandwidth structures	116
3.5.2. High-bandwidth structures, or frequency-independent structures	121
3.6. Reference wire antennas	122
3.7. Quality factor and frequency bandwidth	123
3.7.1. Quality factor	123
3.7.2. Frequency bandwidth	124
3.8. Miniaturization	125
Chapter 4. Characteristic Parameters of an Antenna	131
Jean-Pierre BLOT	
4.1. Characteristic parameters of an antenna	131
4.1.1. Capture surfaces or equivalent surfaces on an antenna	132
4.1.2. Directivity and gain	133
4.1.3. Relation between gain, directivity and radiation pattern	135
4.1.4. Effective height or effective length	136
4.2. Link budget	138
4.3. Power and noise temperature	140
4.3.1. Noise temperature received by an antenna	143
4.3.2. Link budget and Friis formula	144
4.4. Quality factor $Q = G/T$	145
Chapter 5. Digital Methods	149
Jean-Pierre BLOT	
5.1. Introduction to digital methods	149
5.1.1. Overview of the main digital methods	149
5.1.2. Hybridization of digital methods	155
5.1.3. Low-frequency methods	155
5.1.4. Introduction to high-frequency methods	189
5.2. General remarks on EMC methods	195

Appendix 1	197
Appendix 2	201
Appendix 3	219
Appendix 4	227
Appendix 5	231
List of Acronyms and Constants	233
References	235
List of Authors	243
Index	245
