Preface	xi
Chapter 1. Inner Product Spaces (Pre-Hilbert)	1
1.1. Real and complex inner products	1
1.2. The norm associated with an inner product and normed vector spaces	6
1.2.1. The parallelogram law and the polarization formula	9
1.3. Orthogonal and orthonormal families in inner product spaces	11
1.4. Generalized Pythagorean theorem	11
1.5. Orthogonality and linear independence	13
1.6. Orthogonal projection in inner product spaces	15
1.7. Existence of an orthonormal basis: the Gram-Schmidt process	19
1.8. Fundamental properties of orthonormal and orthogonal bases	20
1.9. Summary	28
Chapter 2. The Discrete Fourier Transform and its Applications to Signal and Image Processing	31
2.1. The space $\ell^2(\mathbb{Z}_N)$ and its canonical basis	31
2.1.1. The orthogonal basis of complex exponentials in $\ell^2(\mathbb{Z}_N)$	34
2.2. The orthonormal Fourier basis of $\ell^2(\mathbb{Z}_N)$	38
2.3. The orthogonal Fourier basis of $\ell^2(\mathbb{Z}_N)$	40
2.4. Fourier coefficients and the discrete Fourier transform	41
2.4.1. The inverse discrete Fourier transform	44
2.4.2. Definition of the DFT and the IDFT with the orthonormal Fourier basis	46
2.4.3. The real (orthonormal) Fourier basis	47
2.5. Matrix interpretation of the DFT and the IDFT	48
2.5.1. The fast Fourier transform	51

2.6. The Fourier transform in signal processing	51
2.6.1. Synthesis formula for 1D signals: decomposition on the harmonic basis	51
2.6.2. Signification of Fourier coefficients and spectrums of a 1D signal	53
2.6.3. The synthesis formula and Fourier coefficients of the unit pulse	54
2.6.4. High and low frequencies in the synthesis formula	55
2.6.5. Signal filtering in frequency representation	59
2.6.6. The multiplication operator and its diagonal matrix representation	60
2.6.7. The Fourier multiplier operator	60
2.7. Properties of the DFT	61
2.7.1. Periodicity of \hat{z} and \check{z}	62
2.7.2. DFT and shift	63
2.7.3. DFT and conjugation	67
2.7.4. DFT and convolution	68
2.8. The DFT and stationary operators	73
2.8.1. The DFT and the diagonalization of stationary operators	75
2.8.2. Circulant matrices	77
2.8.3. Exhaustive characterization of stationary operators	78
2.8.4. High-pass, low-pass and band-pass filters	82
2.8.5. Characterizing stationary operators using shift operators	83
2.8.6. Frequency analysis of first and second derivation operators (discrete case)	84
2.9. The two-dimensional discrete Fourier transform (2D DFT)	88
2.9.1. Matrix representation of the 2D DFT: Kronecker product versus iteration of two 1D DFTs	91
2.9.2. Properties of the 2D DFT	93
2.9.3. 2D DFT and stationary operators	95
2.9.4. Gradient and Laplace operators and their action on digital images	97
2.9.5. Visualization of the amplitude spectrum in 2D	97
2.9.6. Filtering: an example of digital image filtering in a Fourier space	100
2.10. Summary	102
Chapter 3. Lebesgue's Measure and Integration Theory	105
3.1. Riemann versus Lebesgue	105
3.2. σ -algebra, measurable space, measures and measured spaces	106
3.3. Measurable functions and almost-everywhere properties (a.e)	108
3.4. Integrable functions and Lebesgue integrals	109

3.5. Characterization of the Lebesgue measure on \mathbb{R} and sets with a null Lebesgue measure	111
3.6. Three theorems for limit operations in integration theory	113
3.7. Summary	114
Chapter 4. Banach Spaces and Hilbert Spaces	115
4.1. Metric topology of inner product spaces	116
4.2. Continuity of fundamental operations in inner product spaces	120
4.2.1. Equivalence of separated topologies in finite-dimension vector spaces	128
4.3. Cauchy sequences and completeness: Banach and Hilbert	129
4.3.1. Completeness of vector spaces	133
4.3.2. Characterizing the completeness of normed vector spaces using series	135
4.3.3. Banach fixed-point theorem	139
4.4. Remarkable examples of Banach and Hilbert spaces	145
4.4.2. L^∞ and ℓ^∞ spaces	156
4.4.3. Inclusion relationships between ℓ^p spaces	161
4.4.4. Inclusion relationships between L^p spaces	163
4.4.5. Density theorems in $L^p(X, \mathcal{A}, \mu)$	165
4.5. Summary	169
Chapter 5. The Geometric Structure of Hilbert Spaces	171
5.1. The orthogonal complement in a Hilbert space and its properties	171
5.2. Projection onto closed convex sets: theorem and consequences	174
5.2.1. Characterization of closed vector subspaces in Hilbert spaces	180
5.3. Polar and bipolar subsets of a Hilbert space	182
5.4. The (orthogonal) projection theorem in a Hilbert space	185
5.5. Orthonormal systems and Hilbert bases	188
5.5.1. Bessel's inequality and Fourier coefficients	189
5.5.2. The Fischer-Riesz theorem	192
5.5.3. Characterizations of a Hilbert basis (or complete orthonormal system)	194
5.5.4. Isomorphisms between Hilbert spaces	199
5.5.5. $\ell^2(\mathbb{N}, \mathbb{K})$ as the prototype of separable Hilbert spaces of infinite dimension	201
5.6. The Fourier Hilbert basis in L^2	202
5.6.1. $L^2[-\pi, \pi]$ or $L^2[0, 2\pi]$	202
5.6.2. $L^2(\mathbb{T})$	204
5.6.3. $L^2[a, b]$	205
5.6.4. Real Fourier series	206
5.6.5. Pointwise convergence of the real Fourier series: Dirichlet's theorem	212

5.6.6. The Gibbs phenomenon and Cesàro summation	214
5.6.7. Speed of convergence to 0 of Fourier coefficients	214
5.6.8. Fourier transform in $L^2(\mathbb{T})$ and shift	218
5.7. Summary	219

Chapter 6. Bounded Linear Operators in Hilbert Spaces 221

6.1. Fundamental properties of bounded linear operators between normed vector spaces	223
6.1.1. Continuity of linear operators defined on a finite-dimensional normed vector space	226
6.2. The operator norm, convergence of operator sequences and Banach algebras	227
6.2.1. A classical example of a non-bounded linear operator on a vector space of infinite dimension	238
6.3. Invertibility of linear operators	239
6.4. The dual of a Hilbert space and the Riesz representation theorem	244
6.4.1. The scalar product induced on the dual of a Hilbert space	249
6.5. Bilinear forms, sesquilinear forms and associated quadratic forms	249
6.5.1. The Lax-Milgram theorem and its consequences	257
6.6. The adjoint operator: presentation and properties	261
6.7. Orthogonal projection operators in a Hilbert space	269
6.7.1. Bounded multiplication operators and their relation to orthogonal projectors	278
6.7.2. Geometric realization of orthogonal projection operators <i>via</i> orthonormal systems	280
6.8. Isometric and unitary operators	286
6.8.1. Characterizations of isometric and unitary operators	288
6.8.2. Relationship between isometric and unitary operators and orthonormal systems	293
6.9. The Fourier transform on $\mathcal{S}(\mathbb{R}^n)$, $L^1(\mathbb{R}^n)$ and $L^2(\mathbb{R}^n)$	296
6.9.1. The invariance of the Schwartz space with respect to the Fourier transform	296
6.9.2. Extension of the Fourier transform of $\mathcal{S}(\mathbb{R}^n)$ to $L^1(\mathbb{R}^n)$: the Riemann-Lebesgue theorem	301
6.9.3. Extension of the Fourier transform to a unitary operator on $L^2(\mathbb{R}^n)$: the Fourier-Plancherel transform	302
6.9.4. Relationship between the Fourier-Plancherel transform and the Hermitian Hilbert basis	305
6.9.5. The Fourier transform and convolution	306
6.9.6. Convolution and Fourier transforms in L^2 : localization of the Fourier transform	309
6.10. The Nyquist-Shannon sampling theorem	310
6.10.1. The Nyquist frequency: aliasing and oversampling	312

6.11. Application of the Fourier transform to solve ordinary and partial differential equations	313
6.11.1. Solving an ordinary differential equation using the Fourier transform	313
6.11.2. The Fourier transform and partial differential equations	315
6.11.3. Solving the partial differential equation for heat propagation using the Fourier transform	316
6.12. Summary	319
Appendix 1: Quotient Space	323
Appendix 2: The Transpose (or Dual) of a Linear Operator	329
Appendix 3: Uniform, Strong and Weak Convergence	331
