INTRODUCTION	ix
CHAPTER 1. CONTAGION AND CAUSALITY IN STATIC MODELS	1
1.1. Linear dependence in a static model	1
1.1.1. The basic model	2
1.1.2. Alternative specifications of the basic model	2
1.1.3. Constrained specifications	7
1.2. Nonlinear dependence in a static model	10
1.2.1. Recursive specification	10
1.2.2. Qualitative observations	12
1.2.3. Factor model	12
1.3. Model with exogenous switching regimes	13
1.3.1. A model with two regimes	14
1.3.2. The identification issue	16
1.4. Chapter 1 highlights	16
1.5. Appendices	17
1.5.1. Proof of lemma 1.1	17
CHAPTER 2. CONTAGION IN STRUCTURAL VARMA MODELS	19
2.1. Shocks in a dynamic model	19
2.1.1. The standard practice	19

2.1.2. Term structure of multipliers	23
2.1.3. Interpretation in terms of contagion and network	25
2.1.4. Measure of connectedness	28
2.2. A vector autoregressive moving average (VARMA) model with independent errors	29
2.2.1. No correlation versus independence	30
2.2.2. The identification result	31
2.3. Non-fundamentalness	34
2.3.1. Ill-located roots	34
2.3.2. Non-invertible process	35
2.3.3. Mixed causal/non-causal process	37
2.4. Chapter 2 highlights	40
2.5. Appendices	41
2.5.1. A property of the causal OLS estimator in VAR(1) model	41
2.5.2. Non-causal solutions of a rational expectation equilibrium model	42
CHAPTER 3. COMMON FRAILTY VERSUS CONTAGION IN LINEAR DYNAMIC MODELS	45
3.1. Linear dynamic model with common factor and contagion	46
3.1.1. The basic specification	46
3.1.2. Extensions	49
3.2. Observable versus latent factors	50
3.2.1. Observable factors	51
3.2.2. Latent common factors	53
3.3. Shocks, impulse response functions and stress	56
3.3.1. Shock on specific factors	56
3.3.2. Shock on the systematic factor	58
3.3.3. Stress tests	58
3.4. Constrained models and misspecification	60
3.4.1. Pure contagion pseudo-model	61
3.4.2. Pure factor pseudo-model	62
3.5. The literature	63

3.5.1. Joint analysis of market returns	63
3.5.2. Term structure of interest rates	64
3.6. Chapter 3 highlights	66
3.7. Appendices	68
3.7.1. Granger causality	68
3.7.2. Seemingly unrelated regression (SUR) model	69
3.7.3. Kalman filter	70
3.7.4. Second-order properties	73
3.7.5. The Yule–Walker equation of order 1	75
3.7.6. Misspecified pure contagion model	76
CHAPTER 4. APPLICATIONS OF LINEAR DYNAMIC MODELS	77
4.1. Portfolio management	77
4.1.1. Asset return models	77
4.1.2. Mean-variance portfolio management	82
4.1.3. Immunized portfolios and mimicking portfolios	85
4.2. Contagion among banks	88
4.2.1. Mixed frequencies	89
4.2.2. Estimation results	90
4.2.3. Impulse response	93
4.3. Chapter 4 highlights	96
4.4. Appendices	98
4.4.1. Decomposition of the variance-covariance matrix	98
CHAPTER 5. COMMON FRAILTY AND CONTAGION IN NONLINEAR DYNAMIC MODELS	101
5.1. Specifications	102
5.1.1. Transition-based specification	103
5.1.2. Regression-based specification	104
5.1.3. Laplace transform-based specification	106
5.1.4. Gaussian linear dynamic model	106
5.2. Stochastic volatility model	108

5.2.1. The return dynamics given the volatility path	108
5.2.2. Specification of the volatility dynamics	110
5.2.3. Overparametrization and constrained models	114
5.3. Application to portfolio management	116
5.3.1. Information sets	116
5.3.2. Arbitrage opportunities	117
5.3.3. Volatility index	117
5.4. Chapter 5 highlights	118
5.5. Appendices	118
5.5.1. Proof of Proposition 5.1	118

CHAPTER 6. AN APPLICATION OF NONLINEAR DYNAMIC MODELS: THE HEDGE

FUND SURVIVAL	121
6.1. HF liquidation data	123
6.2. Dynamic Poisson model	124
6.2.1. Conditional distribution of the liquidation counts	125
6.2.2. The common factor dynamics	127
6.3. Results	127
6.3.1. Estimated networks	128
6.3.2. Factor and factor sensitivities	131
6.3.3. The relative importance of frailty and contagion	136
6.4. Stress-tests	138
6.5. Chapter 6 highlights	142
6.6. Appendices	143
6.6.1. The autoregressive gamma process	143
BIBLIOGRAPHY	145
