Preface	ix
Chapter 1. Presentation of the Formal Computation of Factorization	1
1.1. Definition of the model problem and its functional framework	1
1.2. Direct invariant embedding	4
1.3. Backward invariant embedding	12
1.4. Internal invariant embedding	18
Chapter 2. Justification of the Factorization Computation	23
2.1. Functional framework	23
2.2. Semi-discretization	26
2.3. Passing to the limit	31
Chapter 3. Complements to the Model Problem	41
3.1. An alternative method for obtaining the factorization	41
3.2. Other boundary conditions	43
3.2.1. Boundary conditions on the lateral boundary Σ	43
3.2.2. Boundary conditions on the faces Γ_0 and Γ_a	48
3.2.3. Robin-to-Neumann operator	49
3.2.4. Neumann problem	51

3.3. Explicitly taking into account the boundary conditions and the right-hand side	52
3.4. Periodic boundary conditions in x	58
3.5. An alternative but unstable formulation	59
3.6. Link with the Steklov–Poincaré operator	61
3.7. Application of the Schwarz kernel theorem; link with Green’s functions and Hadamard’s formula	63
Chapter 4. Interpretation of the Factorization through a Control Problem	69
4.1. Formulation of problem (\mathcal{P}_0) in terms of optimal control	69
4.2. Summary of results on the decoupling of optimal control problems	73
4.3. Summary of results of A. Bensoussan on Kalman optimal filtering	77
4.4. Parabolic regularization for the factorization of elliptic boundary value problems	78
4.4.1. Convergence of the operator P_ϵ	84
4.4.2. Parabolic regularization for the Neumann-to-Dirichlet operator	94
Chapter 5. Factorization of the Discretized Problem	99
5.1. Introduction and problem statement	99
5.2. Application of factorization method to problem (\mathcal{P}_h)	102
5.3. A second method of discretization	108
5.4. A third possibility: centered scheme	111
5.5. Row permutation	114
5.6. Case of a discretization of the section by finite elements	118
Chapter 6. Other Problems	127
6.1. General second-order linear elliptic problems	127
6.1.1. Problem statement	127
6.1.2. Factorization by invariant embedding	128
6.2. Systems of coupled boundary value problems	133

6.2.1. Global approach	134
6.2.2. Sequential approach	135
6.3. Linear elasticity system	141
6.3.1. Problem statement and transformation	141
6.3.2. Derivation of the decoupled system	145
6.3.3. Associated control problem	147
6.4. Problems of order higher than 2	149
6.4.1. A factorization of the bilaplacian	149
6.4.2. Another (unstable) factorization of the bilaplacian	152
6.5. Stokes problems	155
6.6. Parabolic problems	163
Chapter 7. Other Shapes of Domain	169
7.1. Domain generalization: transformation preserving orthogonal coordinates	169
7.1.1. Hypotheses on the domain	170
7.1.2. Formal derivation	172
7.2. Quasi-cylindrical domains with normal velocity fields	176
7.3. Sweeping the domain by surfaces of arbitrary shape	181
Chapter 8. Factorization by the QR Method	199
8.1. Normal equation for problem (\mathcal{P}_0) in section 1.1	199
8.2. Factorization of the normal equation by invariant embedding	201
8.3. The QR method	207
Chapter 9. Representation Formulas for Solutions of Riccati Equations	213
9.1. Representation formulas	213
9.2. Diagonalization of the two-point boundary value problem	215
9.3. Homographic representation of $P(x)$	217
9.4. Factorization of problem (\mathcal{P}_0) with a Dirichlet condition at $x = 0$	220

Appendix	221
