Preface	xiii
Acknowledgments	xvii
List of Acronyms	xix
Introduction	xxv
Part 1.	1
Chapter 1. The Foundations of Complexity	3
1.1. Complexities and simplexities: paradigms and perspectives	3
1.1.1. Positioning the problem	4
1.1.2. Reminders, basics and neologisms	5
1.1.3. What are the analytical steps in a complex system?	16
1.1.4. Organization and management principles in complex systems	31
1.1.5. Action and decision processes in self-organized systems	35
1.1.6. Notions of centralization and decentralization	36
1.2. What is the prerequisite for the handling of a complex system?	43
1.3. Applications: industrial complex systems	45
1.3.1. Distributed workshop management system	45
1.3.2. Analysis and diagnosis of a complex system	47
1.3.3. Some recommendations and comments to conclude	48
1.4. Time to conclude	50
1.4.1. Summary	50
1.4.2. Lessons and perspectives	51

Part 2.	53
Chapter 2. Evidencing Field Complexity	55
2.1. Introduction.	55
2.2. Qualitative study of deterministic chaos in a dynamic simple system	58
2.2.1. Description of a few simple cases	58
2.2.2. Initial conditions related to the emergence of chaos	59
2.2.3. Modeling and mathematical analysis of chaos	62
2.2.4. Application at the level of a simple cell.	63
2.3. Test for the presence of deterministic chaos in a simple dynamic system	68
2.3.1. Characterization of the systems studied.	69
2.3.2. A general question: is there deterministic chaos?	70
2.4. Properties of chaos in complex systems	77
2.4.1. Study of an elementary cell	77
2.4.2. Complex cellular systems	81
2.5. Effects of fractal chaos in “Complexity” theory	83
2.5.1. Organized complexity	83
2.5.2. Innovative complexity	84
2.5.3. Random complexity	85
2.5.4. Principles of implementation	87
2.6. Self-organization: relations and the role of chaos	87
2.6.1. Introduction	87
2.6.2. How to combine self-organization and chaos	88
2.6.3. Critical self-organized systems	89
2.6.4. Networked systems and co-operative systems	90
2.6.5. The three states of a dynamic complex system	93
2.6.6. Towards a typology of behavioral complexity	94
2.7. Applications: introduction of new concepts in systems	95
2.7.1. Questions on the management of complex industrial systems.	95
2.7.2. Implementation of the concepts of chaos and self-organization	96
2.8. Conclusions.	98
Chapter 3. The New “Complex” Operational Context	101
3.1. The five phases of economy – how everything accelerates at the same time	101
3.2. The expected impact on just about everything	105

Chapter 4. Taking Up Complexity	109
4.1. Taking into account complex models	109
4.1.1. A brief overview of the approach called “complexity”	109
4.1.2. Another (bio-inspired) vision of the world: universality	112
4.1.3. How to address complexity in this universal world?	115
4.1.4. The usefulness of this book	116
4.2. Economy and management of risks.	117
4.2.1. Important challenges to raise	117
4.2.2. Adapted vocabulary that it is useful to adopt.	118
4.2.3. What do we mean by dynamic pricing?	119
Part 3.	121
Chapter 5. Tackling Complexity with a Methodology.	123
5.1. Any methodology must first enrich the systemic interrelationships	123
5.1.1. The innovation economy: the dynamic management of innovation	124
5.1.2. A basic mechanism of efficient innovation.	125
5.1.3. The benefits of such a shift mechanism.	126
5.2. Towards a transdisciplinary co-economy	126
Chapter 6. Management and Control of Complex Systems	129
6.1. Introduction.	129
6.2. Complex systems: the alternatives	132
6.2.1. Notions of sociability in agent communities	132
6.2.2. The evolutionary principles of complex systems	134
6.3. Control principles of production systems	135
6.3.1. Introduction	135
6.3.2. Control: by scheduling or by configuration?	136
6.3.3. The tools used in monitoring and control.	140
6.4. PABADIS: an example of decentralized control	141
6.4.1. Introduction	141
6.4.2. Context and objectives of the PABADIS project	142
6.4.3. Conceptual overview of PABADIS	142
6.4.4. Principle of adopted convergence: the inverse solution	144
6.4.5. Implementation	145
6.5. Generalization of the concepts and mechanisms	146
6.5.1. Introduction	146
6.5.2. Allocation of resources: the agents in complex production systems.	147
6.5.3. Allocation of resources: the negotiation protocols	147

6.5.4. Optimization of the resource allocation process	148
6.6. A basic mechanism of control – the auction.	150
6.6.1. Introduction	150
6.6.2. The mechanism of the auction	151
6.6.3. Comparative review of the types of auctions.	153
6.6.4. Findings on the interest of the auction mechanism	155
6.7. The control of self-organized systems	156
6.7.1. Introduction	156
6.7.2. The types and mechanisms of self-organization	157
6.7.3. Towards a dynamic integrated model: Cellular Automata (CA).	160
6.7.4. Self-organization: forms and configurations obtained	165
6.7.5. Conclusion and implementation of the ACCA concept, a major model	167
Chapter 7. Platforms for Taking up Complexity	169
7.1. The VFDCS: a platform for implementation	169
7.1.1. Controlling the phenomena of self-organization.	171
7.1.2. Methodology for implementation and the validation of concepts	172
7.2. The application of VFDCS: the auction market	174
7.2.1. The concept of the “Container” in the auction market	176
7.2.2. Feedbacks and results	176
7.2.3. Discussion	178
7.3. The application of VFDCS: the virtual supply chain	179
7.3.1. Introduction	179
7.3.2. Architecture of the virtual supply chain.	181
7.3.3. Results and comments	184
7.3.4. Conclusion.	185
7.3.5. Enhancement of the multi-agent platform	186
7.4. General method for the control of systems	186
7.4.1. Introduction	186
7.4.2. Reminders and definitions.	187
7.4.3. Analytical approach to consistency	188
7.4.4. Methods for the analysis and monitoring of performances.	189
7.4.5. Critical analysis of the convergence of configurations	192
7.5. Conclusions and prospects	194
7.5.1. Synthesis	194
7.5.2. Discussion	195
7.5.3. Comparison of approaches, tools and applications	197
7.5.4. Results	199

Part 4.	201
Introduction to Part 4.	203
Chapter 8. Applying Intrinsic Complexity: The Uberization of the Economy	207
8.1. Preamble	207
8.2. The context: new opportunities and new consumption needs	207
8.3. The domains that are studied in this chapter	208
8.4. Concepts, definitions and remainders	209
8.4.1. Uberization	209
8.4.2. Digitalization of the economy	210
8.4.3. Collaborative consumption (CC).	211
8.4.4. Model generalization: the sharing economy	211
8.4.5. Participatory financing.	211
8.5. The business model and key elements	213
8.5.1. Practicing networks.	213
8.5.2. Positive and negative impacts of network applications	214
8.5.3. The problem of producer–consumers and consumer–producers	215
8.5.4. Underlying mechanisms: some differences with the usual economic systems	216
8.5.5. A form of social hypocrisy?.	217
8.5.6. Generalization: the management rules for P2P	219
8.6. The problem of property and resource allocation.	220
8.6.1. The growing role of platforms	220
8.6.2. The prisoner’s dilemma	223
8.6.3. Games theory: an introduction	224
8.6.4. Nonlinear models in game theory	224
8.7. The uberization approach in context	226
8.7.1. Simplexification.	227
8.7.2. Increasing complexity: the influence of cognitive approaches.	227
8.8. Generalization: the complexity of allocation problems	230
8.9. Conclusion	234
Chapter 9. Computer-assisted Production Management.	235
9.1. Introduction and reminders	235
9.2. Intercommunication networks.	236
9.2.1. Notions of complexity in networks	236

9.2.2. A few concepts of parallelism	237
9.2.3. Elements of parallelism and associated architectures	237
9.2.4. Transposition into industrial or social applications	239
9.3. Communication network topologies	240
9.3.1. Some characteristics of different network topologies.	241
9.3.2. Construction of a hypercube	242
9.3.3. Notions of symmetry: cutting a hypercube	243
9.3.4. The shortest path between two processors	244
9.4. A few important properties.	244
9.5. Analysis of new concepts and methods in manufacturing sciences: instabilities, responsiveness and flexibility	246
9.5.1. General approach: planning and scheduling	247
9.5.2. Illustration in management systems	247
9.5.3. Problems and remarks	250
9.5.4. Improvements in planning and scheduling	251
9.5.5. Improvements in configuration/reconfiguration	252
9.5.6. Global improvements through simulation	253
9.5.7. Inverse modeling and simulation.	254
9.6. New concepts for managing complex systems	256
9.6.1. Traditional approach	257
9.6.2. Recent improvements in the management of systems	260
9.7. The change of conduct	264
9.8. Improvements in manufacturing: process balancing.	266
9.9. Conclusion: main action principles in complex environments	267
Chapter 10. Complexity and Cognitive Robotics	271
10.1. Introduction	271
10.2. The new industrial revolution	272
10.3. The factory of the future: trend or revolution?	272
10.4. Inputs for the factory of the future and their impact on the industry's professions	275
10.5. Conditions for success.	276
10.6. The data sciences.	277
10.6.1. Introduction to the characteristics of "Big Data".	277
10.6.2. The problem of Big Data.	277
10.6.3. A new profession: the data scientist	279
10.6.4. Some ask, how will this be possible?	279
10.6.5. The field of large numbers.	280

10.7. A few technologies in data sciences.	281
10.7.1. The steps of reasoning based on the experience of the inductive approach and on the verification of hypotheses	281
10.7.2. The “Lasso” method	281
10.7.3. Kernel regression methods.	282
10.7.4. The random forests	283
10.7.5. Neural networks	284
10.7.6. Comments on clustering and graph partitioning issues	286
10.7.7. Cognitive informatics – cognitivism	286
10.8. Mechanisms of conventional cognitive engineering	288
10.9. The new mechanisms of engineering	289
10.9.1. Transduction	289
10.9.2. Reasoning by constructed analogies	290
10.10. The study of links and relationships in large databases	290
10.10.1. Comment	291
10.11. Application of cognitive robotics: the Watson platform	291
10.11.1. Applications	292
10.12. The impossibilities and unpredictabilities of complexity	293
10.13. Current strategies of digitalization.	295
10.13.1. Reference examples and discussion	296
10.13.2. GNOSIS.	298
10.13.3. “Data is Centric”.	299
10.14. Conclusion: a maximum risk economy	300
Bibliography	303
Index	327
