General Introduction xxi

Chapter 1. Aerodynamics: Aims, Areas of Application and Current Issues 1

Chapter 2. Aerodynamic Forces: Basic Definitions 7

2.1. Main aerodynamic coefficients 7
2.2. The lift-over-drag ratio and its practical implications. 12
2.3. Curves of lift, drag, and polar 16
2.4. Other coefficients characterizing the effects of a fluid on a body. . . . 18
2.4.1. Effect of pressure. 18
2.4.2. The effect of skin friction 20
2.4.3. Heat flux and heating 20
2.5. Evaluation of the action exerted by a fluid on a body. 21
2.5.1. General relations 21
2.5.2. Lift and drag: drag decomposition 25
2.5.3. Distribution of pressure on an airfoil and lift 26
2.5.4. Aerodynamic stall of an airfoil. 29
2.5.5. Return to the aerodynamic moment: center of pressure 31
2.6. The complete aircraft case: aerodynamic torsor 32

Chapter 3. Review of Thermodynamics 39

3.1. Macroscopic systems, basic state variables, and absolute temperature 39
3.2. Energy exchanges 40

3.3. Postulates of thermodynamics 42
3.3.1. Postulate of the total energy or first law of thermodynamics 42
3.3.2. Internal energy 43
3.3.3. Enthalpy 44
3.3.4. Postulate on entropy and the second law of thermodynamics . . . 45
3.4. Expression of the entropy 47
3.5. Equation of state and the perfect gas model 48
3.6. Isentropic relations for a calorically perfect gas 52
3.7. Comments on the thermodynamics of studied gases 54
3.7.1. Introductory remarks 54
3.7.2. Variation of the specific heats of a thermally perfect gas 55
3.7.3. Dissociation phenomena 57
3.7.4. Mollier diagram 75
3.7.5. Differential parameters of a dissociated gas in equilibrium. 77

Chapter 4. Fundamental Equations of Fluid Mechanics. 81

4.1. Continuous regime and molecular regime 81
4.2. The continuous regime and Navier–Stokes equations 83
4.3. Law of mass conservation and continuity equation 85
4.4. Equation of motion 89
4.5. Expression of the stress tensor 93
4.6. Energy equation 96
4.7. Entropy equation and expression of the heat flux 102
4.8. Summary of basic equations. 105
4.9. Boundary conditions 106
4.10. Acoustic analogy and Lighthill's equation 109

Chapter 5. First Applications of the Conservation Equations 113

5.1. Theorem of the dynalpy 113
5.2. Action of a flow through an engine nacelle: thrust and captation drag 115
5.3. Drag of a vehicle in uniform flow: origin of drag and the Oswatitsch relation 119
5.4. The Betz method for determining drag 125

Chapter 6. Dimensionless Equations: Similarity Parameters. 131

6.1. Normalization of equations: Reynolds, Froude, and Prandtl numbers. 131
6.2. Other notable numbers 138
6.2.1. Temporal similarity and the Strouhal number. 138
6.2.2. Reactive flows and the Damköhler number 139
6.2.3. Multi-species flows and the Lewis number 140

6.3. Similarity conditions and the importance of the Reynolds number 144
6.4. Simulation of the Reynolds number in wind tunnels 148
6.5. Conclusion 151

Chapter 7. Classification of Flows 153

7.1. Viscous and non-viscous flows: Euler equations 153
7.2. Compressible and incompressible flows 158
7.3. Subsonic and supersonic flows 160
7.4. Physical and mathematical approximations. 164

Chapter 8. Fundamental Concepts of Fluid Mechanics 167

8.1. Trajectories, streamlines and streaklines 167
8.1.1. Trajectories in a moving fluid 167
8.1.2. Streamlines of a moving fluid 170
8.1.3. Streak lines of a moving fluid 171
8.1.4. The case of steady flow: stream surface and stream tube 173
8.2. Vorticity, circulation, stream function and velocity potential 175
8.2.1. Vorticity and Crocco's theorem 175
8.2.2. Circulation: Kelvin, Lagrange and Helmholtz theorems. 179
8.2.3. Stream function. 188
8.2.4. Potential function for the velocity or velocity potential 190

Chapter 9. One-Dimensional, Non-Viscous and Adiabatic Steady Flows 193

9.1. Definition and basic hypotheses 193
9.2. The fundamental equations 195
9.2.1. Mass conservation: continuity equation 195
9.2.2. Equation of motion or Euler equation 196
9.2.3. Energy equation 198
9.2.4. Isentropy of the flow. 204
9.3. The Hugoniot theorem 204
9.4. Consequences of the Hugoniot theorem: sonic throat and starting a supersonic nozzle. 208
9.5. Isentropic expansion or compression of a flow 212
9.5.1. Limit velocity concept. 212
9.5.2. Isentropic relations and the area-Mach number relation. 216
9.6. Incompressible case: the Bernoulli relation and application. 226
9.6.1. The Bernoulli relation. 226
9.6.2. Measurement of the velocity: the Pitot probe 227
9.6.3. The Venturi 229

Chapter 10. Application of the One-Dimensional Theory to the Calculation of Supersonic Nozzles 231

10.1. General definition of a supersonic nozzle 231
10.2. Calculation of the flow in the nozzle 233
10.3. Calculation of the nozzle mass flow 236
10.4. Calculation of the nozzle thrust 237
10.5. Conventional thrust at the pressure p_a and adaptation of a nozzle . . 242
10.6. Concluding remarks 248

Chapter 11. One-Dimensional Flows with Friction and Heat Transfer 251

11.1. Friction force and heat transfer on a wall 251
11.2. One-dimensional theory and the generalized Hugoniot relation 255
11.3. Flow with friction without heat input: stagnation pressure drop in a pipe 258
11.4. Flow with heat transfer without friction: thermal choking 264
11.5. Calculating method for a one-dimensional flow with friction and heat transfer 265

Chapter 12. Application of the One-Dimensional Theory to the Calculation of Supersonic Ejectors 269

12.1. Introduction. 269
12.2. Technological and aerodynamic characteristics 270
12.3. Physical analysis of the supersonic ejector 271
12.4. Physical analysis of the mixed regime 274
12.5. Calculation of an ejector with a cylindrical mixing chamber. 277
12.5.1. General calculation conditions 277
12.5.2. The case of the supersonic regime 278
12.5.3. Algorithm for the calculation of the characteristic of the supersonic regime 283
12.5.4. Algorithm for the calculation of the characteristic of the mixed regime 285
12.6. Application examples 287

Chapter 13. Discontinuity Surfaces: Shock Wave and Slip Line 291

13.1. Existence of shock waves 291
13.2. Discontinuity relations: Rankine–Hugoniot equations 294
13.3. Shock wave type solution 298
13.4. Slip line type solution. 300
13.5. Normal shock wave case 305
13.5.1. General relations 305
13.5.2. Case of the calorically perfect gas 306

13.5.3. Normal shock wave with real gas effects and chemical kinetics . . . 317
13.6. Shock structure: the role of viscosity . . . 322

Chapter 14. Oblique Shock Wave and Shock Polar . . . 333

14.1. General solution . . . 333
14.2. Shock polar . . . 336
14.2.1. Polar in the plane (pressure – deflection angle) . . . 336
14.2.2. Polar in the plane (deflection angle – shock angle) . . . 344
14.3. Other properties of the shock polar (pressure – deflection angle) . . . 347
14.4. The oblique planar shock wave reflection problem . . . 352
14.5. Transition from regular reflection to Mach reflection . . . 362
14.6. External, internal and isentropic compressions . . . 364
14.7. Conical shock wave . . . 368
14.8. Indication on the effects of relaxation or non-equilibrium . . . 373

Chapter 15. Shock Intersections or Shock–Shock Interferences . . . 377

15.1. Introduction . . . 377
15.2. Type I interference . . . 380
15.3. Type II interference . . . 384
15.4. Type III interference . . . 386
15.5. Type IV interference . . . 390
15.6. Type V interference . . . 394
15.7. Type VI interference . . . 397
15.8. Lambda shock structure . . . 401
15.9. Transition between type VI and type V interferences . . . 402

Chapter 16. Application of the Shock Wave Theory to Supersonic Air Intakes . . . 405

16.1. The role of air intake . . . 405
16.2. Pitot type air intake . . . 407
16.2.1. Arrangements and definitions . . . 407
16.2.2. Operation in subsonic flight . . . 409
16.2.3. Operation in supersonic flight . . . 410
16.2.4. An important relation between the efficiency and the mass flow coefficient . . . 414
16.3. Two-dimensional supersonic air intake . . . 415
16.3.1. Design and operation regimes . . . 415
16.3.2. Two-dimensional supersonic air intake with multiple ramps . . . 419
16.4. Air intake examples . . . 425

Chapter 17. Supersonic, Steady, Two-Dimensional Flows and the Theory of Characteristics 431

17.1. The theory of characteristics: introduction 431
17.2. Intrinsic equations of the planar or axisymmetric flows 432
17.3. The Cauchy problem and characteristic relations 439
17.4. Characteristic relations for the two-dimensional planar flow of a calorically perfect gas 446
17.5. Applications of the theory of characteristics 448
17.5.1. The progressive expansion wave. 448
17.5.2. The limit case of the Prandtl–Meyer expansion 453
17.5.3. The limit expansion angle. 458
17.5.4. The progressive compression wave 459

Chapter 18. The Numerical Method of Characteristics 463

18.1. Introductory remarks 463
18.2. The basic operators 464
18.2.1. Normal point in a flow: operator N 464
18.2.2. Point on a wall: operator W. 468
18.2.3. Point on a jet boundary: operator J 470
18.2.4. Point on an axisymmetry axis: operator A 471
18.2.5. Origin of a centered expansion: operator Q 473
18.3. Calculation of a supersonic field 474
18.3.1. Domains of dependence and influence 474
18.3.2. Extension of the calculation: taking into account a boundary condition 477
18.4. Some examples of calculation. 479

Chapter 19. Application of the Method of Characteristics to the Calculation of Supersonic Nozzles 483

19.1. General principle 483
19.2. Calculation of the transonic domain 484
19.2.1. The potential equation in compressible flow. 484
19.2.2. The Carrière development method. 487
19.2.3. The Sauer small perturbation method 493
19.3. Calculation of the flow in a nozzle with a given contour: direct method. 496
19.4. Calculation of the contour of a nozzle producing a given flow: inverse or design method. 498
19.5. Example of the definition of the contour of a two-dimensional planar nozzle 502
19.6. Mach rhombus of a nozzle. 506

Chapter 20. Flows with Shock Waves: Rotational Method of Characteristics 509

20.1. Shock wave and rotational flow. 509
20.2. The origin of a shock caused by a wall discontinuity 510
20.3. Origin of a shock caused by a pressure discontinuity 511
20.4. The point on a shock in the vicinity of its origin 513
20.5. Origin of a focalization shock 517
20.6. Normal point of a shock 518
20.7. Calculation examples of flows with shock formation 520
20.8. Application to the analysis of the structure of a supersonic jet 523
20.8.1. Case of the under-expanded jet. 525
20.8.2. Case of the over-expanded jet 528
20.9. Drag of the symmetric bump in supersonic flow 531

Chapter 21. One-Dimensional, Non-Viscous and Adiabatic Unsteady Flows 537

21.1. Introduction. 537
21.2. General equations 538
21.3. Unsteady isentropic flow in a cylindrical tube 540
21.3.1. Equation of motion 540
21.3.2. Cauchy problem and characteristic curves 541
21.3.3. Characteristic relation: Riemann invariants 544
21.3.4. Case of a calorically perfect gas 546
21.3.5. Initial and boundary conditions 548
21.3.6. The expansion wave 549
21.4. The compression wave 561
21.5. Intersection of compression waves: formation of a shock wave 564
21.6. Distortion of a periodic wave and nonlinear acoustics 567
21.7. Reflection–refraction of a wave on a contact surface: acoustic impedance. 569
21.8. Back on the boundary conditions 571

Chapter 22. Unsteady Shock Wave, Contact Surface, and Wave Reflections. 575

22.1. The shock wave equations and relations. 575
22.2. Formation of a shock wave 581
22.3. Contact surface. 584
22.4. Reflection of a wave 585
22.5. Multiple reflections 588
22.6. Collision of two shock waves 591
22.7. Impact of a shock wave on a fixed wall 596

Chapter 23. Shock Tube 603

23.1. General theory 603
23.2. Reflected shock tube 611
23.3. Tailoring the contact surface 613
23.4. Numerical simulation of the functioning of a shock tube 616
23.5. Shock tube arrangement: the shock tunnel 622

Chapter 24. Numerical Methods for Calculating Unsteady Flows 627

24.1. Integration by the method of characteristics 627
24.2. Integration by finite differences 632
24.2.1. Dimensionless equations in conservative form 632
24.2.2. Explicit numerical integration method 638
24.3. Stability condition and CFL criterion (Courant–Friedrich–Lewy) . . 642
24.4. Equations in spherical coordinates: spherical shock wave 645
24.5. Starting and unstarting a supersonic nozzle 650

Chapter 25. Some Properties of Transonic Flows 657

25.1. Introduction. 657
25.2. Potential equation for small disturbances 659
25.3. Compressibility correction: the Prandtl–Glauert rule 663
25.4. Linearized theory for supersonic flows 667
25.5. The small perturbation potential equation in transonic 674
25.6. Final comments on the potential equation 676
25.7. Critical Mach number of an airfoil 677
25.8. Transonic flow around an airfoil 679
25.9. Drag divergence Mach number 683
25.10. Supercritical airfoils 684

General Conclusion 689

Appendix 1. Review of Mathematical Notations and Relations 693

Appendix 2. Table of Useful Relations for the Fundamental Concepts of Aerodynamics 705

Appendix 3. Table of Useful Relations for Stationary One-dimensional Flows and Discontinuity Surfaces 713

Appendix 4. Table of Useful Relations for Applications of the Theory of Characteristics and Transonic Flows 723
