

Table of Contents

Preface	xvii
PART 1. BASIC CONCEPTS OF CHEMICAL KINETICS.	1
Chapter 1. Chemical Reaction and Kinetic Quantities	3
1.1. The chemical reaction.	3
1.1.1. The chemical equation and stoichiometric coefficients.	3
1.1.2. The reaction components	5
1.1.3. Reaction zones	6
1.2. Homogeneous and heterogeneous reactions.	8
1.2.1. Single zone reaction	8
1.2.2. Multizone reaction	8
1.3. Extent and speed of a reaction.	9
1.3.1. Stoichiometric abundance of a component in a reaction mixture	9
1.3.2. Extent of a reaction.	9
1.3.3. Speed of a reaction	11
1.4. Volumetric and areal speed of a monozone reaction.	12
1.5. Fractional extent and rate of a reaction.	14
1.5.1. The fractional extent of a reaction	14
1.5.2. Rate of a reaction	16
1.5.3. Expression of the volumetric speed (areal) from variations in the amount of a component	16
1.6. Reaction speeds and concentrations	18
1.6.1. Concentration of a component in a zone	18
1.6.2. Relationship between concentration and fractional extent in a closed environment	19

1.7. Expression of volumetric speed according to variations in concentration in a closed system	19
1.8. Stoichiometric mixtures and progress	20
1.9. Factors influencing reaction speeds.	21
1.9.1. Influence of temperature.	21
1.9.2. Influence of the concentrations (or partial pressures of gases)	23
1.9.3. Other variables	23
Chapter 2. Reaction Mechanisms and Elementary Steps.	25
2.1. Basic premise of kinetics	25
2.2. Reaction mechanism	26
2.2.1. Definition	26
2.2.2. Examples of mechanisms	27
2.3. Reaction intermediates	29
2.3.1. Excited atoms (or molecules).	29
2.3.2. Free radicals	30
2.3.3. Ions	30
2.3.4. Adsorbed species	31
2.3.5. Point defects	31
2.3.6. The effect of intermediates on extent and speeds	31
2.4. Reaction sequences and Semenov representation	32
2.4.1. Semenov diagram.	32
2.4.2. Linear sequences and multipoint sequences	33
2.5. Chain reactions.	34
2.5.1. Definition	34
2.5.2. The different categories of chain reactions	35
2.5.3. The steps in a chain reaction	35
2.5.4. Sequence of chain reactions.	35
2.5.5. Reactions of macromolecule formation	36
2.6. Catalytic reactions.	37
2.6.1. Homogeneous catalysis	38
2.6.2. Heterogeneous catalysis	39
2.7. Important figures in reaction mechanisms.	41
Chapter 3. Kinetic Properties of Elementary Reactions	43
3.1. Space function of an elementary reaction	43
3.2. Reactivity and rate of an elementary step	44
3.3. Kinetic constants of an elementary step	45
3.3.1. Expression of reactivity as a function of concentrations	45
3.3.2. Rate factor of an elementary reaction	46
3.4. Opposite elementary reactions.	47

3.4.1. Reactivity of two opposite elementary reactions	47
3.4.2. Distance from equilibrium conditions	48
3.4.3. Principle of partial equilibria	49
3.5. Influence of temperature on the reactivities of elementary steps	49
3.5.1. Influence of temperature near the equilibrium	50
3.5.2. Activation energies of opposite elementary reactions and reaction enthalpy	50
3.6. Modeling of a gas phase elementary step	51
3.6.1. Collision theory	52
3.6.2. Theory of activated complex	54
3.7. A particular elementary step: diffusion	58
3.7.1. The diffusion phenomenon	58
3.7.2. Diffusion flux and Fick's first law	58
3.7.3. Diffusion flux in a steady state system	59
3.7.4. Reactivity and diffusion space function	60
3.7.5. Diffusion in solids	62
3.7.6. Interdiffusion of gases	63
3.7.7. Diffusion of a gas in a cylindrical pore	64
3.8. Gases adsorption onto solids	64
3.8.1. Chemisorption equilibrium: Langmuir model	65
3.8.2. Dissociative adsorption and the Langmuir model	66
3.8.3. Chemisorption of gas mixtures in the Langmuir model	68
3.8.4. Chemisorption kinetic in the Langmuir model	70
3.9. Important figures in the kinetic properties of elementary reactions	71
Chapter 4. Kinetic Data Acquisition	73
4.1. Experimental kinetic data of a reaction	73
4.2. Generalities on measuring methods	74
4.3. Chemical methods	74
4.4. Physical methods	75
4.4.1. Methods without separation of components	75
4.4.2. Physical methods with separation of components	84
4.4.3. Study of fast reactions	85
4.5. Researching the influence of various variables	87
4.5.1. Ostwald's isolation method	88
4.5.2. Variables separation	88
Chapter 5. Experimental Laws and Calculation of Kinetic Laws of Homogeneous Systems	91
5.1. Experimental laws in homogeneous kinetics	91
5.1.1. Influence of concentrations	92

5.1.2. Influence of temperature.	94
5.2. Relationship between the speed of a reaction and the speeds of its elementary steps.	95
5.3. Mathematical formulation of speed from a mechanism and experimental conditions	96
5.3.1. Example of resolution of a mechanism in a closed system	96
5.3.2. Example of resolution of a mechanism in an open system with constant concentrations	98
5.4. Mathematical formulation of a homogeneous reaction with open sequence	99
5.4.1. Mathematical formulation in a closed system	99
5.4.2. Mathematical formulation of a system with constant concentrations.	100
5.5. Mathematical formulation of chain reactions	101
5.5.1. Mathematical formulation of a simple homogeneous chain reaction	101
5.5.2. Mathematical formulation of a reaction forming a macromolecule through polymerization	103
Chapter 6. Experimental Data and Calculation of Kinetic Laws of Heterogeneous Reactions.	109
6.1. Heterogeneous reactions	109
6.1.1. Distinctive nature of heterogeneous systems.	109
6.1.2. Rate of a heterogeneous reaction.	110
6.1.3. Different kinetic classes of heterogeneous reactions	110
6.2. Experimental kinetic data of heterogeneous reactions.	112
6.2.1. Catalytic reactions	113
6.2.2. Stoichiometric heterogeneous gas–solid reactions	116
6.3. Involvement of diffusion in matter balances	119
6.3.1. Balance in a slice of a volume zone	120
6.3.2. Balance in a 2D zone.	122
6.3.3. Application of balances to the elementary steps of a sequence of reactions	123
6.3.4. Application to Fick’s second law	124
6.4. Example of mathematical formulation of a heterogeneous catalytic reaction	124
6.5. Example of the mathematical formulation of an evolution process of a phase.	127
6.5.1. Balance of intermediates.	129
6.5.2. Expressions of the reactivities of elementary chemical steps	130
6.5.3. Expressions of the concentrations of species at the interfaces.	130
6.5.4. Diffusion equations of the defects	131

6.5.5. Expressions of the variations in sizes of the zones involved in the reaction	132
6.5.6. Evolution law of the rate chosen to characterize the speed	132
Chapter 7. Pseudo- and Quasi-steady State Modes	135
7.1. Pseudo-steady state mode	135
7.1.1. Definition	135
7.1.2. Uniqueness of the reaction speed in pseudo-steady state mode	136
7.1.3. Linear sequences in pseudo-steady state modes	137
7.1.4. Multipoint sequences in pseudo-steady state mode	140
7.1.5. Experimental research into the pseudo-steady state	141
7.2. Pseudo-steady state sequences with constant volume (or surface) – quasi-steady state	147
7.2.1. Quasi-steady state sequences	147
7.2.2. Linear sequences in quasi-steady state mode	148
7.2.3. Speed of a homogeneous linear sequence in quasi-steady state mode with invariant volume	149
7.2.4. Multipoint sequences in quasi-steady state mode	149
7.3. Pseudo- and quasi-steady state of diffusion	150
7.4. Application to the calculation of speeds in pseudo-steady state or quasi-steady state	151
7.4.1. Principle of the method	151
7.4.2. Example 1: dinitrogen pentoxide decomposition	151
7.4.3. Example 2: hydrogen bromide synthesis	152
7.4.4. Example 3: polymerization	154
7.4.5. Example 4: application of the pseudo-steady state to a heterogeneous catalytic reaction	156
7.5. Pseudo-steady state and open or closed systems	159
7.5.1. Kinetics law in homogeneous closed systems	159
7.5.2. Kinetics law in heterogeneous closed systems	161
7.5.3. Kinetic laws of open systems with constant concentrations	162
7.6. Conclusion	162
7.7. Important figure in pseudo-steady state	163
Chapter 8. Modes with Rate-determining Steps	165
8.1. Mode with one determining step	166
8.1.1. Definition	166
8.1.2. Concentrations theorem for linear sequences	166
8.1.3. Reactivity of the rate-determining step	170
8.1.4. Rate of reaction	171

8.1.5. Calculation of speed of a linear sequence in pure mode determined by one step	172
8.1.6. Pure modes away from equilibrium for linear sequences	179
8.1.7. Influence of temperature on linear sequences	180
8.1.8. Cyclic sequences	182
8.1.9. Conclusion on modes with a single determining step.	183
8.2. Pseudo-steady state mode with two determining steps	185
8.2.1. Definition	185
8.2.2. Mathematical formulation of a mixed pseudo-steady state mode	185
8.2.3. Linear sequences: inverse rate law or the law of slowness.	186
8.2.4. Cyclic sequences	188
8.2.5. Law of characteristic times	188
8.3. Generalization to more than two determining steps	189
8.4. Conclusion to the study of modes with one or several rate-determining steps	190
8.5. First order mode changes.	190
8.6. Conclusion	191
PART 2. REACTION MECHANISMS AND KINETIC PROPERTIES	193
Chapter 9. Establishment and Resolution of a Reaction Mechanism	195
9.1. Families of reaction mechanisms	195
9.2. Different categories of elementary steps.	196
9.2.1. Homolytic bond breaking	196
9.2.2. Heterolytic bond breaking.	196
9.2.3. Ion dissociation	196
9.2.4. Radical reactions	197
9.2.5. Ion–molecule reactions	197
9.2.6. Reactions between ions	199
9.2.7. Interface reactions	199
9.2.8. Reaction between structure elements in the solid state	200
9.2.9. Reactions between adsorbed species and point defects.	200
9.3. Establishment of a reaction mechanism	201
9.3.1. Methodology	201
9.3.2. Rule no. 1: the law of elimination of intermediates	202
9.3.3. Rule no. 2: the rule of the least change of structure (in the case of a single bond)	203
9.3.4. Rule no. 3: the rule of the greatest simplicity of elementary reactions (bimolecular)	203

9.3.5. Rule no. 4: the rule involving a single jump into the solid state	204
9.3.6. Rule no. 5: the law of micro-reversibility.	204
9.4. Research into a mechanism: intermediary reactions	205
9.4.1. Reaction filiations: primary and non-primary products.	205
9.4.2. Labile intermediates	208
9.5. Back to the modes and laws of kinetics	210
9.5.1. Modes with a single rate-determining step	210
9.5.2. Modes with multiple rate-determining steps	211
9.5.3. Pseudo-steady state modes	211
9.5.4. Link between the form of the rate equation and the presence of some elementary steps	211
9.6. Experimental tests	212
9.6.1. Experimental methods	212
9.6.2. The pseudo-steady state mode test	216
9.6.3. Research into the uniqueness of the space function mechanism or ϕE test	216
9.7. Looking for the type of rate law.	218
9.7.1. Research into the influence of concentrations	218
9.7.2. Research into the influence of temperature.	220
Chapter 10. Theory of the Activated Complex in the Gas Phase	223
10.1. The notion of molecular energy: the energy of a group of atoms	223
10.1.1. Energy of a group of two atoms	223
10.1.2. Energy of an even number of atoms	225
10.2.3. Energy of an odd number of atoms.	226
10.2. Bimolecular reactions in the gas phase	227
10.2.1. Postulate of the activated molecular collision	228
10.2.2. Potential energy surface	229
10.2.3. Reaction pathways and the equivalent “mass point”	231
10.2.4. Absolute expression of the reaction rate.	233
10.2.5. Partition functions of the activated complex	236
10.2.6. Evaluation of the pre-exponential factor	237
10.2.7. Activation energies	239
10.2.8. Units and other forms of the reaction rate coefficient.	242
10.3. Monomolecular reactions in the gas phase.	243
10.4. Photochemical elementary reactions	248
10.4.1. Grothaus–Draper quantitative law	248
10.4.2. Energetic paths of molecule dissociation	249
10.4.3. Einstein’s quantitative law.	250
10.4.4. Influence of temperature on photochemical reactions.	251
10.5. The theory of activated complexes	252

Chapter 11. Modeling Elementary Reactions in Condensed Phase	253
11.1. Elementary reaction in the liquid phase	253
11.1.1. Generic expression of an elementary-step reaction rate in the liquid phase: the Brønstedt–Bjerrum law	254
11.1.2. Influence of the environment	256
11.1.3. Comparison of the reaction rate in solution and gas phases	257
11.1.4. Reactions between ions in diluted solution	258
11.1.5. Reactions in concentrated solutions: the acidity factor	262
11.2. Elementary reaction in the solid state	268
11.2.1. Potential energy of a solid	268
11.2.2. Reaction pathway	269
11.2.3. Rate of an elementary jump	270
11.2.4. Diffusion in solids	272
11.3. Interphase reactions	276
11.3.1. Gas–solid interphases: adsorption, desorption	276
11.3.2. Solid–solid interface: the concept of epitaxy	277
11.4. Electrochemical reactions	280
11.4.1. Definition	280
11.4.2. Reactivity of an electrochemical reaction	281
11.4.3. The De Donder–Pourbaix inequality	282
11.4.4. Polarization curves	282
11.4.5. Polarization curve equation	285
11.5. Conclusion	290
Chapter 12. The Kinetics of Chain Reactions	291
12.1. Definition of a chain reaction	291
12.2. The kinetic characteristics of chain reactions	292
12.3. Classification of chain reactions	293
12.3.1. Straight or non-branched chain reactions	293
12.3.2. Reactions with direct branching	294
12.3.3. Reactions with indirect branching	294
12.4. Chain reaction sequences	295
12.4.1. Initiation of a chain reaction	295
12.4.2. Propagation of a chain reaction	297
12.4.3. Chain breaking	298
12.4.4. Branching chain reaction	298
12.5. Kinetic study of straight chain or non-branch chain reactions	299
12.5.1. Mean length of the chains	299
12.5.2. Expression of the reaction rate	302
12.5.3. Calculation of the rate and mean length of chains in the reactor	303

12.5.4. Variation of reaction rate with temperature	310
12.5.5. Permanency of the pseudo-steady state mode and reactant consumption	310
12.6. Kinetic study of chain reactions with direct branching	311
12.6.1. Simplified representation of reactions with direct branching	312
12.6.2. Mean chain lengths: condition of the appearance of a pseudo-steady state.	314
12.6.3. Example of a chain reaction with both linear branching and breaking in the bulk.	316
12.6.4. Example of the calculation of the measures related to a branching chain reaction	318
12.7. Semenov and the kinetics of chain reactions	321
Chapter 13. Catalysis and Catalyzed Reactions	323
13.1. Homogenous catalysis.	324
13.1.1. Specific acid–base catalysis by H ⁺ and OH ⁻ ions	325
13.1.2. Generic acid–base catalysis	327
13.1.3. Catalysis by Lewis acids.	329
13.1.4. Redox catalysis	331
13.1.5. Autocatalytic reactions.	331
13.1.6. Enzymatic catalysis.	332
13.2. Heterogeneous catalysis reactions.	335
13.2.1. Experimental laws in heterogeneous catalysis	335
13.2.2. Structure of the mechanism of heterogeneous catalysis.	336
13.2.3. Kinetics of the catalytic act	337
13.2.4. Example of the kinetics of catalysis on a porous support.	343
13.2.5. Influence of the catalyst surface area: poisoning.	350
13.3. Gas–solid reactions leading to a gas	351
13.4. Conclusion on catalysis	352
13.5. Langmiur and Hinshelwood	352
Chapter 14. Kinetics of Heterogeneous Stoichiometric Reactions	353
14.1. Extent versus time and rate versus extent curves	354
14.2. The global model with two processes.	355
14.3. The ϕE law	356
14.4. Morphological modeling of the growing space function	357
14.4.1. The hypothesis.	357
14.4.2. Types of model involving one or two processes	360
14.4.3. Experimental research on the type of morphological model.	372

14.5. The nucleation process	373
14.5.1. Description of the nucleation process	373
14.5.2. Thermodynamics of nucleation	374
14.5.3. The nucleation mechanism	378
14.5.4. The nucleation rate	380
14.5.5. Surface and nucleation frequencies	383
14.6. Physico-chemical growth models	384
14.7. Conclusion on heterogeneous reactions	386
14.8. Important figures in reaction kinetics	387
Chapter 15. Kinetics of Non-pseudo-steady State Modes	389
15.1. Partial pseudo-steady state modes	389
15.2. The parabolic law of metal oxidation	392
15.3. Thermal runaway and ignition of reactions	395
15.4. Chemical ignition of gaseous mixtures	397
15.4.1. Branched chains with linear branching and chain breaking in the bulk	397
15.4.2. Branched chains with linear branching and breaking in the bulk and heterogeneous breaking on the walls	398
APPENDICES	405
Appendix 1. Point Defects and Structure Elements of Solids	407
A1.1. Point defects of solids	407
A1.2. Definition of a structural element	408
A1.3. Symbolic representation of structure elements	409
A1.4. Reactions involving structure elements in quasi-chemical reactions	411
A1.5. Equilibria and reactivities of quasi-chemical reactions	411
Appendix 2. Notions of Microscopic Thermodynamics	413
A2.1. Molecule distribution between the different energy states	413
A2.2. Partition functions	416
A2.3. Degrees of freedom of a molecule	418
A2.4. Elementary partition functions	418
A2.4.1. Vibration partition function	418
A2.4.2. Rotation partition function	419
A2.4.3. Translation partition function	420
A2.4.4. Order of magnitude of partition functions	420

A2.5. Expression of thermodynamic functions from partition functions	420
A2.5.1. Internal energy	421
A2.5.2. Entropy	421
A2.5.3. Free energy	422
A2.6. Equilibrium constant and partition functions	422
Appendix 3. Vibration Frequency of the Activated Complex	425
Notations and Symbols	431
Bibliography	439
Index	441
