LIST OF TABLES	xiii
LIST OF ALGORITHMS	xv
LIST OF ACRONYMS	xvii
PREFACE	xix
ACKNOWLEDGEMENTS	xxi
CHAPTER 1. METAHEURISTICS – LOCAL METHODS	1
1.1. Overview	1
1.2. Monte Carlo principle	6
1.3. Hill climbing	12
1.4. Taboo search	20
1.4.1. Principle	20
1.4.2. Greedy descent algorithm	20
1.4.3. Taboo search method	23
1.4.4. Taboo list	25
1.4.5. Taboo search algorithm	26
1.4.6. Intensification and diversification	30
1.4.7. Application examples	31
1.5. Simulated annealing	39
1.5.1. Principle of thermal annealing	39

1.5.2. Kirkpatrick's model of thermal annealing	41
1.5.3. Simulated annealing algorithm	43
1.6. Tunneling	46
1.6.1. Tunneling principle	46
1.6.2. Types of tunneling	48
1.6.3. Tunneling algorithm.	49
1.7. GRASP methods	51
CHAPTER 2. METAHEURISTICS – GLOBAL METHODS	53
2.1. Principle of evolutionary metaheuristics	53
2.2. Genetic algorithms	55
2.2.1. Biology breviary	55
2.2.2. Features of genetic algorithms	57
2.2.3. General structure of a GA	73
2.2.4. On the convergence of GA	77
2.2.5. How to implement a genetic algorithm.	84
2.3. Hill climbing by evolutionary strategies	100
2.3.1. Climbing by the steepest ascent	101
2.3.2. Climbing by the next ascent	104
2.3.3. Hill climbing by group of alpinists	106
2.4. Optimization by ant colonies	107
2.4.1. Ant colonies.	107
2.4.2. Basic optimization algorithm by ant colonies.	110
2.4.3. Pheromone trail update	118
2.4.4. Systemic ant colony algorithm.	122
2.4.5. Traveling salesman example	128
2.5. Particle swarm optimization	132
2.5.1. Basic metaheuristic	132
2.5.2. Standard PSO algorithm	141
2.5.3. Adaptive PSO algorithm with evolutionary strategy	146
2.5.4. Fireflies algorithm	163
2.5.5. Bats algorithm	173
2.5.6. Bees algorithm	182
2.5.7. Multivariable prediction by PSO	194
2.6. Optimization by harmony search.	207
2.6.1. Musical composition and optimization.	207
2.6.2. Harmony search model	208
2.6.3. Standard harmony search algorithm	212
2.6.4. Application example	215

CHAPTER 3. STOCHASTIC OPTIMIZATION	219
3.1. Introduction	219
3.2. Stochastic optimization problem	221
3.3. Computing the repartition function of a random variable	222
3.4. Statistical criteria for optimality	230
3.4.1. Case of totally admissible solutions.	231
3.4.2. Case of partially admissible solutions	234
3.5. Examples	240
3.6. Stochastic optimization through games theory.	245
3.6.1. Principle	245
3.6.2. Wald strategy (maximin)	247
3.6.3. Hurwicz strategy	248
3.6.4. Laplace strategy	249
3.6.5. Bayes–Laplace strategy	249
3.6.6. Savage strategy	250
3.6.7. Example	251
 CHAPTER 4. MULTI-CRITERIA OPTIMIZATION	 253
4.1. Introduction	253
4.2. Introductory examples	255
4.2.1. Choosing the first job	255
4.2.2. Selecting an IT tool	256
4.2.3. Setting the production rate of a continuous process plant	256
4.3. Multi-criteria optimization problems	257
4.3.1. Two subclasses of problems	257
4.3.2. Dominance and Pareto optimality	262
4.4. Model solving methods	265
4.4.1. Classifications	265
4.4.2. Substitution-based methods	266
4.4.3. Aggregation-based methods	270
4.4.4. Other methods	282
4.5. Two objective functions optimization for advanced control systems	292
4.5.1. Aggregating identification with the design of a dynamical control system.	292
4.5.2. Aggregating decision model identification with the supervision	302
4.6. Notes and comments	307

CHAPTER 5. METHODS AND TOOLS FOR MODEL-BASED DECISION-MAKING.	309
5.1. Introduction	309
5.2. Introductory examples	310
5.2.1. Choosing a job: probabilistic case.	310
5.2.2. Starting a business	311
5.2.3. Selecting an IT engineer	311
5.3. Decisions and decision activities.	
Basic concepts	313
5.3.1. Definition	313
5.3.2. Approaches	314
5.4. Decision analysis	316
5.4.1. Preliminary analysis: preparing the choice	317
5.4.2. Making a choice: structuring and solving decision problems	330
5.5. Notes and comments	347
5.6. Other remarks/comments	347
CHAPTER 6. DECISION-MAKING – CASE STUDY SIMULATION.	351
6.1. Decision problem in uncertain environment	351
6.2. Problem statement	352
6.3. Simulation principle	353
6.4. Case studies	357
6.4.1. Stock management.	358
6.4.2. Competitive tender.	362
6.4.3. Queuing process or ATM.	365
APPENDIX 1	369
APPENDIX 2	377
BIBLIOGRAPHY	393
INDEX	413

List of Figures

1.1. Empirical estimation of Pythagoras' number by Monte Carlo method	8
1.2. Admissible movements in the problem of minimum expense rates for computer network maintenance missions	32
1.3. Characteristic probability surface of annealing Kirkpatrick's model	42
1.4. Illustration of tunneling principle	47
2.1. Illustration of simple crossover between two chromosomes	58
2.2. Example of masking crossover between two chromosomes	59
2.3. Effect of mutation in a chromosome.	59
2.4. Example of permutation	60
2.5. Effect of inversion in a chromosome	60
2.6. Example of non-viable crossover in the traveling salesman problem	62
2.7. General structure of a genetic algorithm	74
2.8. Examples of time-frequency-scale atoms on a waveforms dictionary	86
2.9. Noise attenuation of a signal by using a waveform dictionary.	87
2.10. Illustration of the strong fractal nature of the fitness in the problem of bearings mechanical faults detecting.	90

2.11. Possible definition of the chromosome in the problem of bearings mechanical faults detection	90
2.12. Passing to the next generation by using the elitist generational strategy.	92
2.13. Adaptive variation of the annealing temperature in the problem of bearings mechanical faults detecting.	94
2.14. Generate the initial population in the problem of bearings mechanical faults detecting	95
2.15. Illustration of natural ant colony behavior leading to the optimality	108
2.16. Parameters and variables in a graph associated to ACA	111
2.17. Example of French cities network for the traveling salesmen problem: a) in the beginning of search; b) in the end of search	128
2.18. Principle of particle swarm optimization	134
2.19. Tendencies the particle is tempted to follow	137
2.20. Flow diagram of the bee colony algorithm	189
2.21. Components of a time series.	197
2.22. Example of PQ fractal variation	202
2.23. Plants in a greenhouse and their ecological parameters	203
2.24. Variations of the ecological parameters coming from plant #5 in the greenhouse.	203
2.25. Particle populations for the predictors: a) ARMA, b) ARMAX, c) Kalman–Bucy.	205
2.26. Variations of plants suffering level in a greenhouse, before and after applying predictive control techniques	206
4.1. Graphical representation of Pareto dominance.	263
4.2. Flow diagram of optimal adaptive-robust model-controller design	302
4.3. Principle of supervisory control	303
5.1. Fundamental and auxiliary objectives	319
5.2. Risk profiles: a) probability distribution and b) cumulative distribution function	327
5.3. Probability wheel	328
5.4. One-dimension value function	331

5.5. Graphical tools to solve decision-making problems. a) Influence diagram and b) Decision tree	332
6.1. Typical decision-making approach	351
6.2. Flow diagram of a new product launch	356
6.3. Entering controllable and non-controllable inputs (new product launch)	357
6.4. Simulation (new product launch).	357
6.5. Simulation outcomes (new product launch)	357
6.6. Flow diagram to solve the stock management problem	360
6.7. Entering controllable and non-controllable inputs (stock management)	360
6.8. Simulation parameters (stock management)	360
6.9. Simulation results (stock management)	361
6.10. Evolution of output parameters as a function of Q (stock management)	361
6.11. Flow diagram to solve the competitive tender problem	363
6.12. Simulation with $X = 750$ k€ (competitive tender)	363
6.13. Simulation with $X = 600$ k€ (competitive tender)	364
6.14. Simulation with $X = 700$ k€ (competitive tender)	364
6.15. Graphical analysis for X between 600 and 800 k€	364
6.16. Flow diagram modeling the behavior of an ATM queue	366
6.17. Inputs of the ATM queuing process	366
6.18. Simulation of the ATM queuing process	367
6.19. Results for a single ATM queue	367
6.20. Results for a couple of available ATM	368
A1.1. Generating (B)PRS by a hardware method	370
A1.2. Autocorrelation of PRS generated by a hardware method	373
A2.1. SUS mechanism illustrated by means of an ideal (casino) roulette.	379
A2.2. SUS mechanism illustrated by means of a virtual (casino) roulette	381
A2.3. Representations for implementation of ideal and virtual roulettes	381

A2.4. One-dimensional PRS generated by means of MATLAB functions rand a) and randn b)	388
A2.5. Two-dimensional PRS generated by means of MATLAB functions rand a) and randn b)	389
A2.6. Adapting the Gaussian distribution to a selection set	390
A2.7. Possible variation of occurrence frequencies	391
